Report on blood examination of 306 birds made in the winter of 1953–54 at the Horseshoe Lake Game Refuge, Illinois. Heavy infection with microfilariae of *Ornithofilaria*(?) sp. was found in all age groups. Microfilariae of *Sarconema eurycerca* were found in 9.5% of the yearlings and 4.5% of the adults. Survival experiments with the microfilariae are also reported.

51576. HANSON, HAROLD CARSTEN, 1917– , *and* C. CURRIE. The kill of wild geese by the natives of the Hudson-James Bay region. (Arctic, 1957. v. 10, no. 4, p. 211–29, illus., tables.) 19 refs.

The economic plight of Indians and Eskimos in the Hudson-James Bay area is partly dependent on the numbers of wild geese nesting in or migrating through their territory. The information presented on kills indicates that the number taken by native hunters is within a safe limit of what the nesting populations of that area can withstand. Expansion of wintering grounds and inaccessibility of breeding grounds assure that wild geese will continue to be an important source of food for the northern natives. ***Copy seen:*** CaMAI.

51577. HANZELY, JOSEPH BERNARD. The respiratory metabolism of excised tissue of the arctic blackfish, *Dallia pectoralis* Bean, at various temperatures. Washington, D.C., 1957. 54 p. illus., tables. (Catholic University of America. Biological studies, no. 40.) 51 refs.

Account of investigations made at temperatures of 5°, 15° and 25° C. Brain, liver and muscle tissue was used. O_2-consumption and intermediate carbohydrate metabolism were examined. O_2-consumption was low even in comparison with other arctic fish, indicating cold adaptation down to the cellular level; study of dehydrogenase suggests cold adaptation at the enzyme level. The investigation was initiated at the Aeromedical Laboratory, Ladd Air Force Base, Alaska. ***Copy seen:*** CaMAI.

51578. HARANG, LEIV, 1902– . Height distribution of the red auroral line in polar aurorae. Oslo, H. Aschehoug, Jan. 1958. 9 p. illus., diagrs. (Norske videnskaps-akademi i Oslo. Geofysiske publikasjoner, v. 20, no. 5.) 5 refs.

Recordings of luminosity curves along vertical cross-sections were made at Tromsø (Φ=70° N.), Norway, by means of a photoelectric photometer of the lines 6300, 5577, and the band 4278. The intensity of 6300 shows a considerably slower decrease with height than the green line and the violet band. The character of the luminosity curves is demonstrated for various auroral forms. The effect is explained as due to a decrease in deactivation with height of the long-lived *D*-state of the O-atom.

51584. HARE, FREDERICK KENNETH, 1919– , *and* S. ORVIG. The arctic circulation: a preliminary review. Montreal, June 30, 1958. xiv, 211 p., 83 maps, charts, diagrs., 12 tables. (McGill University. Arctic Meteorology Research Group. Publication in meteorology no. 12. Contracts AF 19(604)–1141 and AF 19(604)–1868, supplement to final reports. Research sponsored by Geophysics Research Directorate, U.S. Air Force Cambridge Research Center,

Air Research and Development Command.) 129 refs. Draft of a study to be combined with another, on arctic analysis and forecasting, in preparation by R. J. Reed at University of Washington, to form a manual of arctic meteorology.

Descriptive review of the climatology of the atmospheric circulation over the Arctic and sub-Arctic, from sea level up to 30 km. The area is delimited on the basis of certain quasi-stationary geographical distributions (natural vegetation, permafrost, ice, etc.). General characteristics of the North Polar circulation are noted: its variable limits, its slow-moving, large cellular structure, presence of the circumpolar vortex, difference from antarctic circulation, the predominantly horizontal nature of disturbances, and the important part played by the stratosphere. Five aspects are treated in detail: the mean motion of the lower troposphere, the circumpolar vortex, the mean stratospheric circulation above 16 km. (100 mb.), climatology of synoptic systems, and non-adiabatic modifications of surface air in the Arctic. Disturbances are treated separately, as are special features of circulation and temperature, such as the arctic inversion and the role of Greenland. Textual information is summarized in pressure and temperature charts, meridional cross-sections, upper air soundings, vertical profiles, frequency charts, synoptic charts of special situations, and maps and tables of various arctic features.

51585. HARE, FREDERICK KENNETH, 1919– . Arctic geography and climate. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 1, pub. 1958, p. 3–8, text map.) 8 refs.

Limits of the Arctic and sub-Arctic can be defined on the basis of five quasi-stationary geographical distributions that are in partial equilibrium with the present climate, viz: the zonation of natural vegetation; the occurrence of permafrost and patterned ground; the distribution of sea, lake, and river ice; the remains of continental glaciers; the circulation of Arctic and sub-Arctic water masses. These distributions are discussed briefly in relation to climate and delineated in combination upon a map.

51586. HARE, FREDERICK KENNETH, 1919– . The quantitative representation of the north polar pressure field. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 1, *pub.* 1958, p. 137–50, maps, diagr.) 11 refs.

Two methods of obtaining analytical expressions for the surface and 500-mb. pressure fields over the north polar region are described briefly. One involves the fitting of the pressure to a series of orthogonal polynomial surfaces. The second involves the use of Fourier transforms in which the colatitude terms are expanded in orthogonal polynomials. The application of the methods is discussed. ***Copy seen:*** DLC.

51587. HARE, FREDERICK KENNETH, 1919– , *and others*. Specification of pressure fields and flow patterns in polar regions; theories and techniques. Montreal, Jan. 1957. 72 p. 3 maps, diagrs., 9 tables. (McGill University. Arctic Meteorology Research Group. Publication in meteorology no. 5, Scientific report no. 3, Contr. AF 19 (604)–1141.) refs. *Other authors:* W. L. Godson, M. A. MacFarlane, *and* C. V. Wilson.

Three papers are presented, viz:

The quantitative specification of the north polar pressure field: mathematical techniques, by F. K. Hare (p. 1–21, 2 diagrs. 11 refs.). General description of methods of specification of pressure fields, reviews existing methods, especially as applied to polar areas; notes steps necessary in all methods, and describes method of orthogonal polynomials; preliminary results show this method to be economical and to give excellent results for polar areas.

The numerical representation of atmospheric flow patterns in polar areas, by W. L. Godson (p. 22–24. 3 refs.). *Discusses* a combination of functions particularly applicable to the polar regions; computation is more extensive than that for the simpler model described by Hare, and parameters required for specification are numerous. Physical interpretation is easier with this method. Consideration is also given to the use of machine methods for the solution of the equations for expansion coefficients.

Working procedure for specification of pressure surfaces, by M. A. MacFarlane and C. V. Wilson (p. 45–72, 2 text maps, diagrs., 17 tables). *Gives* computational details of the specification systems, described by Hare and Godson with examples. ***Copy seen:*** DWB.

51588. HARE, FREDERICK KENNETH, 1919– . Studies in arctic meteorology. Montreal, Mar. 1958. 60 p., 11 diagrs. incl. 1 fold., 12 maps, 2 tables. (McGill University. Arctic Meteorology Research Group. Publication in meteorology, no. 10.) 18 refs. Contract no. AF19(604)–1141. Final report.

Reviews the organization, personnel, objectives and work of the Group, established in Sept. 1954 under author's direction to investigate the atmospheric circulation over the high northern latitudes. Reports published and projected are listed. Research results summarized (p. 8–57) include: the introduction of two quantitative measures of arctic inversions; viz: a rational system of classification, and a measure of inversion intensity, by A. D. Belmont (No. 43941); further application of specification techniques to problems in synoptic climatology, by M. A. MacFarlane and C. V. Wilson, q.q.v.; the application of a two-level, baroclinic, prediction model to the arctic circulation, by M. A. Estoque (No. 50799); the prospects for dynamical prediction over the Arctic are better than in mid-latitudes, given an adequate station net work; an application of statistical techniques involved in specification to the dynamics of the arctic atmosphere, specifically the definition of persistence, by M. A. MacFarlane (No. 51239); an analysis of the synoptic regimes in the lower arctic troposphere, by C. V. Wilson (No. 56073); etc.

51591. HARLAND, WALTER BRIAN, 1917– . The Caledonian sequence in Ny Friesland, Spitsbergen. (Geological Society of London. Proceedings, Feb. 4, 1958. Session 1957–58, no. 1557, p. 30–33.)

The structure of the Ny Friesland sector (approx. 79°30′ N. 17° E.) is outlined for the first time and summarized in a map and sections, based mainly on the last ten years' observations. The structure reflects the formation of a geosyncline of Hecla Hoek rocks (late Precambrian to mid-Ordovician) and their deformation in the Ny Friesland orogeny, followed by Old Red Sandstone deposition and deformation in the Svalbard folding. Thus a mobile history (the Caledonian sequence) stretches from late Precambrian to Upper Devonian times, and reaches its climax in the Ny Friesland orogeny (between mid-Ordovician and late Silurian). The sequence is compared with that in other areas, particularly East Greenland. ***Copy seen:*** DGS.

51593. HARP, ELMER, 1913– . Arctic. (American antiquity, Jan. 1957. v. 22, no. 3, p. 323.)

Reports on T. P. Bank's study in Japan on North Pacific culture transfer, his expedition to the Okhotsk Sea coast of Hokkaido. Certain similarities of Hokkaido material with Denbigh stone artifacts and affinities with ancient Aleut culture are noted. The theory of a possible spread to Hokkaido via Sakhalin of a north Siberian, strongly Eskimoid, pre-Ainu culture is suggested.

Copy seen: DLC.

51594. HARP, ELMER, 1913– . Arctic. (American antiquity, Apr. 1957. v. 22, no.4, pt. 1, p. 436–37.)

Reports on J. L. Giddings' excavation, in 1956, of a house pit on the Chukchi Sea side of Choris Peninsula (66°20′ N. 161°50′ W.,), estimated as 3,000–4,000 years old; R. S. MacNeish's field work at the Firth River site in Yukon Territory and his correlations of its occupational sequences to geological, faunal and archeological data are discussed. An Old Copper culture burial excavated by A. C. Spaulding in Michigan yielded finds claimed to support his hypothesis that Old Copper belonged to an ancient boreal forest culture forming part of the proto-Eskimo culture. ***Copy seen:*** DLC.

51595. HARP, ELMER, 1913– . Arctic. (American antiquity, July 1957. v. 23, no. 1, p. 97–98.)

Reports on 1956 field work and cites projects for 1957. Gordon H. Marsh surveyed a row of rectangular house pits at Aleksandrovsk on English Bay, South Alaska, and test-pitted an animal bone deposit near Manley Hot Springs on the Lower Tanana River. The latter yielded bones of an extinct form of bison but no trace of human habitation. A new site containing material that does not seem to fit any of the known American arctic complexes was discovered by John M. Campbell on the west bank of Contact Creek in Anaktuvuk Pass, Brooks Range. Wm. E. Taylor and Charles H. McNutt continued work at Native Point begun by Henry B. Collins, with emphasis on the study of architecture, artifacts and skeletal material of Sadlermiut Eskimos. Their culture, according to H. B. Collins, was probably initially Dorset later overlaid by strong Thule influences.

Copy seen: DLC.

51596. HARP, ELMER, 1913– . Arctic. (American antiquity, Jan. 1958. v. 23, no. 3, p. 330.)

John M. Campbell of Yale University completed his second excavation season in Anaktuvuk Pass, in the Brooks Range, northern Alaska, a site showing no definite links with any known complex in the American Arctic. The use of obsidian, a material not known to occur in arctic Alaska, and the continued significant occurrence of leaf-shaped projectile points with oblique flaking and diamond-shaped cross section are noted. Jørgen Meldgaard of the Danish National Museum excavating on Igloolik Island, off Melville Peninsula, investigated a series of house types of pre-Dorset occupation, in near contact with Dorset culture.

Copy seen: DLC.

51597. HARP, ELMER, 1913– . Arctic. (American antiquity, Apr. 1958. v. 23, no. 4, pt. 1, p. 452–53.)

Reports on the activities of the Human History Branch of the National Museum of Canada: Richard S. MacNeish surveying the Dawson - Lake Mayo - Lake Teslin - Alaskan border region of Yukon Territory located 97 sites attributed by him to five separate complexes; deeply buried unifacial tools were unearthed near the mouth of the Pelly River and pebble choppers from near Dawson. W. Taylor surveyed the area of Payne Bay, Payne Lake and Sugluk Inlet, Ungava Peninsula; Dorset houses and sites were observed and excavated; the most important, a burial on an island in the Payne estuary, yielded an Eskimoid skull and Dorset tools, thus linking concretely the Eskimo physical type with the Dorset culture. ***Copy seen:*** DLC.

51598. HARP, ELMER, 1913– . Prehistory in the Dismal Lake area, N.W.T., Canada. (Arctic, 1958. v. 11, no. 4, p. 219–49, illus., maps.) 39 refs.

Reports on the summer 1955 archeological survey of the Coronation Gulf area. Test diggings at three sites on Dismal Lake (1:a, 1:b, 2) and one at Kamut

Lake yielded numerous chipped and flaked stone implements (knives, scrapers, points, burins, etc.). The large proportion of microlithic artifacts at Dismal-2 and Kamut Lake sites is noted and "the ancestral role of microlithic technology" in the American Arctic stressed. The central position of the Dismal-Kamut Lake complexes and the technological relationship of the microlithic Dismal-2 complex to the western sites of Engigstciak (No. 46551), Anaktuvuk Pass and Cape Denbigh as well as east to the Sarqaq culture of West Greenland, Independence I & II in Pearyland (No. 52343) and the proto-Dorset T–1 site on Southampton Island (No. 44425, 50311) are discussed. Dismal-2 is related in some way to the Dorset culture, it shows traits of all stages from proto- to late Dorset. The ecology of the Dorset culture and its dual land- and sea-oriented economy are dealt with and the musk-ox considered an important game animal in the Dismal Lake area. In the "geographical funnel" of Alaska-northwest Canada, compounds of culture occur, attesting it an area where Old World impulses met, diffused and gave rise to New World complexes including the "Eskimo" traits found in archaic Indian cultures of the east coast from Labrador to Maryland. ***Copy seen:*** CaMAI.

51599. HARRINGTON, LYN. Crossroads of the duck world. (Nature magazine, Dec. 1958. v. 51, no. 10, p. 533–36, illus.)

Description of the Waterfowl Research Station at Delta Marsh, Manitoba, with its wide range of habitats. The aim of the station is "to study ducks at their source, to serve as clearing-house for information, and direct such knowledge to useful ends in field biology."

Hypothermic dogs survived a four-hour compression of the renal artery, while five out of six normothermic animals died of uremia five to nine days after similar intervention. In five of the cooled animals, plasma NPN did not rise above normal levels, while in one there was only a transient increase. Hypothermia, by reducing the tissue's O_2-demand during ischemia, prevents irreversible lesion of the tubular epithelium. ***Copy seen:*** DNLM.

HART, HENRY CHICHESTER, *see* Fries, T. M. On the lichens collected . . . 1875–76. *1880.* No. 50994.

51607. HART, JACKSON SANFORD, 1916– . Climatic and temperature-induced changes in the energetics of homeotherms. (Revue canadienne de biologie, June 1957. v. 16, no. 2, p. 133–74, illus., tables.) 127 refs.

Review article dealing with temperature-induced changes, changes produced by climate (seasons) and a comparison between them. These two main problems are further analyzed with the view of ascertaining the effects of acclimation on cold resistance and its limits; metabolic changes and changes in body insulation caused by low environmental temperature. The effects of developmental history, of other environmental factors, etc. upon reaction to cold are also discussed.

Copy seen: DLC.

51608. HART, JACKSON SANFORD, 1916– . The influence of thermal acclimation on limitation of running activity by cold in deer mice. (Canadian journal of zoology, Apr. 1953. v. 31, no. 2, p. 117–20, illus.) 8 refs.

Of two groups of mice, one acclimated to cold (10° C.) showed a minimal running capacity at −20° C. and a maximal between −5° and +20° C. In both groups the lower limit for activity was reduced 10° C. when acclimation temperature was lowered by 20°.

Copy seen: DLC.

51609. HART, JACKSON SANFORD, 1916– . Metabolic alterations during chronic exposure to cold. (Federation proceedings. Symposium on metabolic aspects of adaptation of warm-blooded animals to cold environment, Dec. 1958. v. 17, no. 4, p. 1045–54, illus., table.) 107 refs.

A review of "metabolic acclimation" in a variety of laboratory animals, with emphasis on the cellular responses to cold. Alterations in general and in tissue metabolism, mechanisms of heat production, hormonal control and intermediary metabolism, are discussed. Increased oxidation of fats, carbohydrates and possibly proteins during exposure to cold is indicated. ***Copy seen:*** DLC.

51610. HART, JACKSON SANFORD, 1916– . Rate of gain and loss of cold resistance in mice. (Canadian journal of zoology, Apr. 1953. v. 31, no. 2, p. 112–16, illus.) 14 refs.

Resistance time at −17° C. was 67 min. in mice acclimated to 30° C., and 1,730 min. in the group acclimated to 10° C. When the two groups were shifted to opposite acclimation temperatures, change of resistance time was greatest in the first two weeks and became equal in both groups after two weeks.

Copy seen: DLC.

51611. HART, JACKSON SANFORD, 1916– . The relation between thermal history and cold resistance in certain species of rodents. (Canadian journal of zoology, Apr. 1953. v. 31, no. 2, p. 80–98, illus., tables.) 24 refs.

Of the animals studied, rats were more resistant to cold than deer mice, and deer mice more resistant than white mice. Time to death at given temperature (resistance time) declined and temperature producing death increased accordingly in the same order. Sex and body weight affected cold-resistance only slightly.

Copy seen: DLC.

51612. HART, JACKSON SANFORD, 1916– . Seasonal changes in insulation of the fur. (Canadian journal of zoology, Feb. 1956. v. 34, no. 1, p. 53–57, illus., table.) 13 refs.

Report on investigation of nine arctic and north temperature species. Relative seasonal changes varied between 12 and 52% of the winter value. The largest mammals with thickest furs showed the greatest absolute changes, suggesting that in smaller mammals changes in heat production may be operative in seasonal acclimation. ***Copy seen:*** DLC.

51613. HARTWIG, WERNER. Ein Beitrag zum Studium der Wirtschaft der Nanaier (Golden). (Leipzig. Museum für Völkerkunde. Jahrbuch 1955. Bd. 14, *pub.* 1956. p. 74–98, illus.) 15 refs. Text in German. ***Title tr.:*** A contribution to the study of the economy of the Nanayans (Golds).

Deals with an unpublished manuscript by Fritz Dorries, a German entomologist who spent 22 years (1874–1896) in Siberia studying butterflies also collecting data on the aboriginals. Discovered among the museum's ethnographic holdings, the manuscript sketches the material culture of the settled fishers of the Amur region, the "Gillan"- and "Hrsin"-Golds. Their fishing and hunting gear and technique, clothing (originally of fish skin), dwellings (semi-subterranean winter-houses, bark-covered summer huts, thatched storage structures on stilts), means of transportation (dugouts, bark canoes, dog-drawn sledges), etc. are described and compared with those of other taiga-hunters and fishers of northeastern Siberia.

51621. HATTERSLEY-SMITH, GEOFFREY F. The Ellesmere ice shelf and the ice islands. (Canadian geographer, 1957. no. 9, p. 65–70, 2 text maps.) 21 refs.

The origin of ice islands is discussed on the basis of recent investigations and air photographs, and the ice drifts, surface currents, and paths of T–1, T–2, and T–3, in the Arctic Basin are mapped. The drift of T–3, its structure, thickness, surface pattern, and rock material suggest that it could have originated only from the Ellesmere ice shelf, as also T–1 and T–2. Of the possible parts of the North Ellesmere coast from which the islands may have stemmed, Yelverton Bay seems the most likely. Rock material of T–3 may have originated from the shores of the Bay, while the ice may have come from one of the tidewater glaciers. Severnaya Zemlya is a possible source area of some of the smaller ice islands.

Copy seen: DLC.

51622. HATTERSLEY-SMITH, GEOFFREY F. Glaciological research in northern Ellesmere Island. (Canadian geographer, 1958. no. 12, p. 32–34.)

Describes 1957 work of the Canadian Defence Research Board's IGY expedition, making glaciological and meteorological studies on the icecap and on Gilman Glacier. Investigations on the balance between accumulation and ablation and movement indicate they are in a better state of balance than icecaps and

glaciers further south. The recent climatic amelioration appears to have had less effect in this than other parts of the arctic. ***Copy seen:*** DGS.

51623. HATTERSLEY-SMITH, GEOFFREY F., *and* F. S. GRANT. Glaciological work on "Operation Hazen," northern Ellesmere Island, 1957. (Canadian alpine journal, 1958. v. 41, p. 89–91.)

Operation Hazen 1957–58, part of the Canadian IGY program, established a base camp on the north shore of Lake Hazen Apr.–May 1957 and an advanced camp on Gilman Glacier (photo). Studies were made between the snout of Gilman (1,360 ft.) and Mt. Oxford (7,170 ft.) 27 mi. west-northwest, of accumulation and ablation, level of firn line, snow temperatures, and ice movement. The glacier appeared to be nearly in a state of balance. Geophysical studies were also carried on: considerable variation in seismic velocity with depth near the surface of Gilman Glacier was observed, probably representing a progressive compaction of firn. ***Copy seen:*** DGS.

51624. HATTERSLEY-SMITH, GEOFFREY F. The rolls on the Ellesmere ice shelf. (Arctic, 1957. v. 10, p. 32–44, 5 illus., text map.) 16 refs.

Surface rolls are characteristic features of both the Ellesmere ice shelf and the floating ice islands derived from it. These surface features are described and their origin and evolution discussed. Various theories of origin are considered which involve such forces as pressure from the polar pack, movement of glaciers, temperature variations, tidal movements and wind. Of these, wind action appears the most likely to have caused the rolls, and it is suggested that their development was analogous to the formation of *seif* dunes in a desert. "They should be regarded as fossil snow dunes that have been perpetuated by the annual drainage of melt-water."

51628. HAUGHTON, SAMUEL, 1821–1897. On the tides of the arctic seas: part I, on the diurnal tides of Port Leopold, North Somerset; part II, the semidiurnal tides of Port Leopold, North Somerset. (Royal Society of London. Philosophical transactions, 1863. v. 153, part 11, p. 243–72, 3 plates, tables,

graphs.) Refs in text. Correction in the same journal, 1866, v. 156, p. 654–55.

Discusses tidal observations made aboard the *Investigator* in the winter of 1848–49 while fast in ice at 74° N. 90° W. during the J. C. Ross Expedition in Search for Franklin. The observations are tabulated, and diurnal and semidiurnal tides are computed. Comparative graphs are presented on the range of the tides, the variation in spring and neap tides, etc. Different approaches are attempted in using the data to compute the mean depth of the channel which conveys the tide from the South Atlantic to Port Leopold. ***Copy seen:*** DLC.

51629. HAUGHTON, SAMUEL, 1821–1897. On the tides of the arctic seas: part III, on the semidiurnal tides of Frederiksdal, near Cape Farewell, in Greenland. (Royal Society of London. Philosophical transactions, 1866. v. 156, part 22, p. 639–55, tables, graphs.)

Discusses daily recordings of high and low tide, made at 60° N. 45° W. by Asboé, a Danish missionary Aug. 1863–Aug. 1864. The observations are tabulated, also ranges of spring and neap tides. Eccentricity of the lunar orbit, mass of the moon, and depth of the sea are computed; the parallactic inequality is graphed. ***Copy seen:*** DLC.

51630. HAUGHTON, SAMUEL, 1821–1897. On the tides of the arctic seas: part IV, on the tides of Northumberland Sound, at the northern outlet of Wellington Channel. (Royal Society of London. Philosophical transactions, 1875. v. 165, part 11, p. 317–29, tables.)

Presents tabulated values of time and height of high and low water, and computed data on diurnal and semidiurnal tides at high and low water, based on observations made May 24–July 6, 1853 at 76°52′ N. 97° W. aboard the *Assistance* during Sir Edward Belcher's expedition in search of Franklin. ***Copy seen:*** DLC.

51631. HAUGHTON, SAMUEL, 1821–1897. On the tides of the arctic seas: part V, on the tides of Refuge Cove, Wellington Channel. (Royal Society of London. Philosophical transactions, 1875. v. 165, part 12, p. 331–37, tables.)

Discusses tidal observations made aboard the *Assistance* Sept. 16–Oct. 11, 1853 at 75°31′ N. 92°10′ W. during the Belcher expedition. Data are tabulated on high and low water, diurnal tide, and lunitidal intervals; mean values of heights and intervals of the semidiurnal tide are given. ***Copy seen:*** DLC.

51632. HAUGHTON, SAMUEL, 1821–1897. On the tides of the arctic seas: part VI, tides at Port Kennedy, in Bellot Strait. (Royal Society of London, Philosophical transactions, 1875. v. 165, part 13, p. 339–60, tables.)

Discusses hourly tidal observations made on the *Fox* July 5–28, 1859 at 72°01′ N. 94°15′ W. during Sir Leopold M'Clintock's expedition in search of Franklin. Data are tabulated on hourly values of diurnal and semidiurnal tide, times of principal phases of the diurnal tide, max. and min. apparent diurnal solitidal intervals, times of half-flood and half-ebb and heights of high and low water of the diurnal tide, heights and lunitidal intervals of the semidiurnal tide and times and lunitidal intervals of half-flood and half-ebb of the semidiurnal tide. ***Copy seen:*** DLC.

51633. HAUGHTON, SAMUEL, 1821–1897. On the tides of the arctic seas: part VII, tides of Port Kennedy, in Bellot Strait; final discussion. (Royal Society of London. Philosophical transactions, 1878, v. 169, pt. 1, p. 1–16, tables.)

Computes the diurnal and semidiurnal tidal constants in accordance with Fourier's theorem and other advanced formulae, from the observations presented and discussed in No. 51632. ***Copy seen:*** DLC.

51634. HAUGHTON, SAMUEL, 1821–1897. On the tides of the arctic seas: part VIII, on the tides of Lady Franklin Sound. (Royal Irish Academy. Transactions, Nov. 1893. v. 30, part 9, p. 325–46, tables.)

Discusses hourly tidal observations made on board the *Discovery* Sept. 16, 1875–Mar. 28, 1876, while the ship lay embedded in the ice at 81°45′ N. 65° W. during the 1875–76 British Arctic Expedition. Mean tide level, diurnal, semidiurnal, and tertiodiurnal tides are computed according to Fourier's theorem. ***Copy seen:*** DLC.

51635. HAUGHTON, SAMUEL, 1821–1897. On the tides of the arctic seas: part IX, on the tides of the northwestern entrance of Robeson Channel, Grinnell Land. (Royal Irish Academy. Transactions, Feb. 1895. v. 30, part 15, p. 587–96, tables.)

Discusses hourly tidal observations made on board the *Alert* Sept. 29–Oct. 23,

1875, and Dec. 12, 1875–Jan. 11, 1876, while the ship was moored off the northeast Ellesmere coast at 82°27′ N. 61°22′ W. during the British Arctic Expedition 1875–76. Due to incompleteness of the observations, only the semidiurnal tide is computed. ***Copy seen:*** DLC.

Report on histological investigation of two brains of *Balaenoptera physalus* L. and, for comparison, a human brain. The results indicate that the increase in number of glia cells per nerve cell is not correlated with phylogenetic development but with brain weight.

Copy seen: DLC.

51638. HAWKSLEY, OSKAR. Ecology of a breeding population of arctic terns. (Bird-banding, Apr. 1957. v. 27, no. 2, p. 57–92, 4 diagrs., 6 tables.) 96 refs.

Contains results of a study of the behavior and ecology of *Sterna paradiseae,* carried out during the breeding seasons of 1947 and 1948 on Machias Seal Island in the Bay of Fundy, New Brunswick, supplemented by previous observations on this arctic species in Alaska, Churchill (Hudson Bay) and elsewhere. Arctic terns are principally deep-water feeders but adapt readily to changes in food supply. Weather and light affect food producing and social activity. Nesting sites with little vegetation are mostly desirable. Associates include a great variety of other charadriiform and anseriform birds; among the more important predators are gulls, hawks, jaegers and some mammals. Arctic terns lay smaller clutches in the Bay of Fundy than in arctic and subarctic regions. Suggestions for management include control of vegetation and predators. ***Copy seen:*** DSI.

Summary in English. *Other authors:* E. Julin *and* A. Pekkari. ***Title tr.:*** *Stratiotes* lakes in Norrbotten.

Contains data on the occurrence of *Stratiotes aloides* in Källträsket, a lake in the southeastern section of Nederkalix parish in Norrbotten (65°52′ N.), and in some other lakes. Many other eutrophic plants such as *Ceratophyllum demersum* and *Potamogeton friesii* (cf. table 2) were found. The faunal population includes Turbellaria, Hirudinea and Mollusca (table 3). Some hibernal observations and chemical analyses are tabulated. The dispersion biology of *Stratiotes* and *Ceratophyllum* is discussed, and the suggestion offered that both species came to these lakes by drift from the White Sea with fresh water, during the warm Allerod period, about 11,000 years ago. ***Copy seen:*** DSI.

51646. HEDLUND, HANS, 1901– . Ett försök att odla skog ovanför skogsodlingsgränsen på Killingi i Gällivare socken. (Skogen, *Stockholm*, July 1, 1955. årg. 42, nr. 13, p. 237–38, illus.) Text in Swedish. ***Title tr.:*** An attempt at cultivating forests above the reforestation limit at Killingi in Gällivare parish.

Describes an experiment by 43 farmers of this small town (67°10′ N. 20°40′ E.) to reforest some 130 hectares of barren mountain meadows at 500 m. elevation. As coniferous trees once grew in this region, the farmers (with state aid) started pine-seeding in 1937, planting 1952, and fenced the reforestation area against reindeer. Pine growth is shown feasible in locations of this high altitude, but whether economic is not yet known. ***Copy seen:*** DLC.

51647. HEDLUND, HANS, 1901– . Svenska skogsbruk; Arjeplogs revir. (Skogen, *Stockholm*, Jan. 15, 1955. årg. 42. nr. 2, p. 30–32, illus.) Text in Swedish. ***Title tr.:*** Swedish forestry; Arjeplog forest district.

This district of 194,000 hectares of productive forests around the lakes Hornavan, Uddjaur, and Storavan (approx. 66° N. 18° E.), has old and degenerate pine stands. Birch, the chief enemy of pine regeneration is being eliminated by burning or aerial spraying (helicopter) with hormone derivatives. Natural regeneration, in the main feasible by leaving seed trees when preparing the ground, is supplemented by some planting. ***Copy seen:*** DA.

51648. HEDLUND, JOHN. Swedish mining review, 1957. (Canadian mining journal, June 1958. v. 79, no. 6, p. 110–11, table.)

Reports development, production and export in the metal mining industry: improvements, administrative changes, exploration or mining halted, tabular data for 1953–1957 on production and export; iron ore (most important), pyrite,

lead, zinc, and copper concentrates are the main products. ***Copy seen:*** DGS.

51650. HEEZEN, BRUCE C. Whales entangled in deep sea cables. (Norsk hvalfangst-tidende, Dec. 1957. årg. 46, nr. 12, p. 665–81, illus., map, table.) Text in Norwegian and in English. 11 refs. Contribution no. 234 from Lamont Geological Observatory pub. in Deep sea research, 1957, v. 4.

Data are given on 14 cases of whales entangled in submarine cables: six at a depth of about 500 fathoms, 620 fathoms being the maximum depth reported. Those identified whales were all sperm whales. The cable was generally wrapped round the jaw, often round the flukes and fins, was rarely broken but always badly mauled. It is concluded that sperm whales swim along the sea floor at depths as great as 620 fathoms, become entangled while swimming with the jaw ploughing through the sediment in search of food.

A third of the Finnish forest area is moorland. About half of the forested moors are pine stands on heath moors. Clean cutting of such forest in northern Finland has been found to result in more satisfactory natural renewal than the customary method of only partial clearing. Relationships between the cutting, good seed year, and new growth are considered. ***Copy seen:*** DLC.

HEIL, WILLI, *see* Kannt, H. S., *and others*. Eisbrecher "General San Martin." *1955*. No. 52166.

51655. HEILBORN, OTTO. Chromosome numbers and dimensions, species-formation and phylogeny in the genus *Carex*. (Hereditas, 1924. bd. 5, häfte 2, p. 129–216, 22 illus., plate, 7 tables.) 85 refs.

Chromosome numbers of 44 species or forms of sedge are tabulated (p. 134); 22 different, exactly determined numbers ranging 9–56 have been found; they cannot be arranged in a series of multiples as in other genera. Great differences in size are often found between chromosomes within the same nucleus. A few cases of irregular chromosome distribution in meiosis are described. One of the most important processes in species-formation in *Carex*, has been the formation of mutants with one extra chromosome which, in a later generation, have given rise to mutants with the diploid number increased by two. The chromosome numbers are important in the phylogeny of the genus (fig. 13, p. 197). In some genera only one chromosome number has been found in many species. The genus *C.*, of which 22 irregular chromosome numbers are known, occupies a unique position within the vegetable kingdom, *C. rupestris* and *C. canescentes* from Troms, Norway, and *C. capillaris* from northern Sweden, are included in the discussion. ***Copy seen:*** DLC.

51656. HEILBORN, OTTO. Chromosome numbers in *Draba*. (Hereditas, 1927. bd. 9, p. 59–68, 2 illus.) 9 refs.

Chromosome counting is reported in 24 species of this herbaceous genus, seven in northern Scandinavia and Greenland, and one in Kamchatka Peninsula (*unalaschkiana*). The chromosome numbers within the genus form the series 8, 16, 24, 32, 40. The relationship between *D. rupestris* and *D. magellanica* (Greenland, Spitsbergen and Kuusamo, Finland) is investigated. The first species is uniform, the latter consists of three cytological types (24, 32, 40).

51657. HEILBORN, OTTO. Chromosome studies in Cyperaceae. (Hereditas, 1928. bd. 11, häfte 2–3, p. 182–92, 3 illus., 4 tables.) 5 refs.

In 56 species and two hybrids of the genus *Carex*, 24 different chromosome numbers were found, ranging from 9 to 56. Of the investigated 58 forms, ten have numbers from 9 to 25, while 47 have numbers from 26 to 42, and one has 56 chromosomes. Four of the species were collected in northern Sweden: *C. saxatilis*, *C. magellanica*, *C. capitata* and *C. atrofusca*, near Abisko, and *C. tenuiflora* in the vicinity of Kiruna.

Copy seen: DLC.

51658. HEILBORN, OTTO. Chromosome studies in Cyperaceae, III–IV. (Hereditas, 1939. bd. 25, häfte 3, p. 224–40, illus., 3 tables.) 22 refs.

Contains tabulated data on chromosome numbers, and on the systematic value of the numbers. Three of the species studied are from Abisko, Torne Lappmark, viz.: *Carex lachenalii* (n=32), *C. macloviana* (n=43), and *Elyna myosuroides* (n=52–

59). Allopolyploidy seems to be lacking, but there is proof of autopolyploidy. Structural rearrangement of chromosomes (translocation, fusion or fragmentation) contributes to the aneuploid condition in the family. Pt. I–II of this series (not numbered) *supra.*

Title tr.: Forest cultivation on piecework rates; one aspect of the attempt to solve cultivation problems at a large Norrland forest concern.

Time studies were made by Mo och Domsjö AB on the various operations involved in preparing the ground, planting, and sowing; different implements and sites of varying difficulty were used. Results are presented in graphical and tabular form. Piecework rates per 1,000 units of area or per 1,000 plants, are graphed for work periods of different lengths, at various per diem wage rates, on the basis of the piece-rate at 125% the per diem rate. ***Copy seen:*** DA.

51676. HELSTAD, K. Finnmarksbrev, I-II. (Skogbrukeren, Oct. 15, Nov. 1, 1953. årg. 28, nr. 20, 21, p. 311–12, 325–26.) Text in Norwegian. ***Title tr.:*** Letter from Finnmark, I–II.

Traces the population of Finnmark back to 10,000–12,000 B.C., when (according to the Komsa antiquities, excavated in 1925) primitive tribes from the east populated an ice-free strip of coastland. Lapps and Norwegians (around 800 B.C.) and later Finns migrated to the area. Author's experimental planting of trees on the Nordkyn Peninsula and proposed establishment of two nurseries in Finnmark are noted. In pt. II, plants and birds observed in the vicinity of Nordkapp in early spring (June–July) are described: first to bloom are various willows, *Salix lanata, S. cineria* and *S. polaris.* Early wildflowers *Pedicularis lapponica, Dryas octopètata, Heracleum sibiricum* or the Tromsø palm, etc. develop under the snow, and are in full bloom when it melts. Birds observed were eider gulls, mergansers, loons, etc. Writer's statements are challenged (p. 344).

(Dansk naturhistorisk Forening. Videnskabelige meddelelser, 1956. bd. 118, p. 243–315, 16 illus., 5 tables.) 89 refs.

Contains results of study of the oviposition of six crane-fly species by insertion of the entire abdomen into the soil, digging with the shovel-shaped cerci. Among them is *Tipula* (*Vestiplex*) *arctica* observed on a visit to the Danish military base Grønnedal (61°14′ N. 48°06′ W.) in southwest Greenland. These species oviposit in forest soil, in alpine areas and in the arctic region. The method of deep oviposition is considered an adaptation to dry biotopes and protection of the eggs against dessication; it is also favorable for wing reduction (tables 1–5), a tendency existing especially in the females. ***Copy seen:*** DLC.

51679. HEMPHILL, ERNEST. Countdown at Churchill. (Canadian aviation,

Aug. 1958. v. 31, no. 8, p. 37–39, 75, illus.)

Describes activities at the launching site, where approx. 40 Aerobee and 44 Nike-Cajun rockets will be fired in the IGY program to study temperatures, pressures and wind velocities, infra-red and cosmic radiation, composition and activity of the aurorae, etc. The rocket site, with facilities and equipment valued at over $10 million, has heated tunnels connecting all main buildings and the launching pads. The Aerobee-Hi launching pad has a vehicle track which can be swung 360° in azimuth and 10° in the vertical to direct the firing angle; a four-station Doppler Velocity and Positioning System fixes flight positions with an accuracy of one in 50,000.

51680. HEMPHILL, ERNEST, *and* **P. BRANNAN.** A cure for carriers' ills. (Canadian aviation, May 1958. v. 31, no. 5, p. 26–29, 75, illus.)

Discusses decline in Canadian civil air transport volume in 1957, due mainly to termination of construction on the radar-defense chains; several companies seek compensation in northward expansion of civilian traffic. Some experience in arctic operation is summarized. The single-engined Beaver and Otter have proved dependable; the Caribou, built for operation at −40° F. to 120° F., is expected to give good performance. The Fairchild F–27, employing a pneumatic system instead of hydraulics, may eliminate troubles with frozen hydraulic lines. Aircraft maintenance is dealt with; a heated, tent-like device, enclosing the engine nacelle and surrounding portions of the wing, secures heat distribution to the entire lubrication system and provides comfort during engine overhaul and repair. ***Copy seen:*** DLC.

51681. HEMSTOCK, RUSSELL A. An appraisal of muskeg technology in Canada. (Canadian mining and metallurgical bulletin, Oct. 1958. v. 51, no. 558, p. 643–45.) 7 refs.

Reviews progress, especially in Canada, toward understanding and using muskeg or peat lands. Data on the *in situ* physical properties and development of machinery and vehicles for such areas are required. Railways will probably provide the main transportation in the North, supported by roads, fixed-wing aircraft and by helicopters. ***Copy seen:*** DGS.

51683. HENDRICKS, STERLING B. Control of growth and reproduction by light and darkness. (Science in progress, 1957. v. 10, p. 157–80, illus., tables.)

A review of animal and plant responses to seasonal changes in light, and of the mechanisms underlying them. Plants and animals of lower and higher phyla are considered, among them some arctic forms (trout, ptarmigan). Features of the responses and their experimental elucidation; effect of wave length of light, and of photoperiodicity, as well as the role of darkness are discussed in relation to plants. Growth and reproductive reactions of arthropods and vertebrates (including man) to seasonal and experimental changes in light are also analyzed. ***Copy seen:*** DNLM.

51684. HENNEMAN, DOROTHY H., *and others.* Immediate metabolic response to hypothermia in man. (Journal of applied physiology, Mar. 1958. v. 12, no. 2, p. 164–68, illus.) 19 refs. *Other*

authors: J. P. Bunker *and* W. R. Brewster, Jr.

Cooling of ten subjects to 28°–30° C. in thiopentalcurare anesthesia and hyperventilation caused changes in arterial blood electrolytes, similar to those of respiratory alcalosis without hypothermia. An inhibition of glucose uptake and its subsequent glycolysis (by tissues) was also suggested. Metabolic acidosis did not occur in uncomplicated hypothermia.

51685. HENRY, T. J. G. Maps of upper winds over Canada. Toronto, 1957. 61 p. diagrs., text maps. (Canada. Meteorological Branch) 17 refs.

Contains seasonal maps, two for each season, and two each for the 850, 700, 500, 300 and 200 mb. levels. The first map of each pair represents the vector mean flow; the second shows the variability of the wind about its vector mean, as expressed by the standard vector deviation. Maps are based on short-period observations. Text reviews development of upper-air observations in Canada since the 1930's; published summaries and analyses of data are noted. Properties of upper wind distributions (observed and computed), are discussed; construction of the maps is described, to obtain the seasonal normal contour patterns for standard isobaric surfaces; procedure used in constructing isopleths of vector mean wind speed for each level and season is outlined; calculation of standard vector deviation is given. The picture of the vector mean circulation and the patterns of standard vector deviation as shown by the maps are discussed; essential agreement with results of earlier studies is found. ***Copy seen:*** DN–HO.

51686. HENRY, WALTER K. Yukon River floods. (*In:* Alaskan Science Conference . . . 1954. Proceedings *pub.* 1957, p. 76–77.)

Notes dates and heights of extensive floods at: Fort Yukon since 1936, Galena since 1925, and Ruby (highest) in 1925. Formation and effects of ice jams, and their relation to temperatures in several parts of Alaska are described.

Account of the present and future industrial and economic development of Yakutia by *Humanité*'s permanent correspondent in the U.S.S.R. He traveled in Yakut A.S.S.R. in Sept. 1956(?), visited Yakutsk, a mixed agricultural, dairy, reindeer and silver fox-breeding kolkhoz 80 km. down the Lena River, Oymyakon and Angarsk. He reports an interview with P. F. Shvetsov, director of the Institute of Cold (sic) on an IGY station planned near the Cold Pole in the Suntar-Khayata Range. The discovery of the diamond-bearing kimberlite pipe at Mir in 1954, and the Kolyma basin coal deposits, those of Sangara on the Lena and Chul'man south of the Aldan are discussed; the last about 700 x 100 km. in area consists of a coal bed 40 m. thick at a depth of 300 m. Plans are outlined for resource development, plant construction, and new industrial centers.

51700. HÉROUX, OLIVER, 1922– , *and* J. ST. PIERRE. Effect of cold acclimation and vascularization of ears, heart, liver and muscles of white rats. (American journal of physiology, Jan. 1957. v. 188, no. 1, p. 163–68, illus., tables.) 13 refs.

Animals kept four weeks at 6° C. showed no effect on the number of capillaries of the heart and liver-sinusoid but showed a 12-fold increase in the ear. In various regions of the leg-muscle there was also a considerable increase in the number of capillaries. These changes are assumed to indicate higher metabolism in the cold-adapted animals.

51701. HÉROUX, OLIVER, 1922– , *and* N. T. GRIDGEMAN. The effect of cold acclimation on the size of organs and tissues of the rat with special reference to modes of expression of results. (Canadian journal of biochemistry and physiology, Feb. 1958. v. 36, no. 2, p. 209–216, illus., tables.) 9 refs.

Account of studies of white rats kept at 6° C. or at 30° C. Cold environment and adaptation had no effect on brain, genital and lung weights; they reduced growth of muscle, pelt, fat, skeleton, spleen, thymus and hypertrophied the liver, intestine, kidney, heart and adrenals. The smaller size of cold acclimated rats is attributed to the smaller mass of muscle. ***Copy seen:*** DNLM.

51702. HÉROUX, OLIVER, 1922– . Effect of cold acclimation on thickness and mitotic index of epidermis. (Federation proceedings, Mar. 1957. v. 16, no. 1, pt. 1, p. 58.)

The Malpighian layer of the epidermis in rats exposed during four weeks to 6° C. was twice as thick in the ear and tail as before acclimation, but remained unchanged in the plantar and fur-covered areas. Data on the mitotic index of the various areas investigated are also discussed in this connection.

51703. HÉROUX, OLIVER, 1922– . Weights and composition of muscles of warm- and cold-acclimated rats. (Canadian journal of biochemistry and physiology, Mar. 1958. v. 36, no. 3, p. 289–93, tables.) 5 refs.

After cold acclimation at 6° C., white rats were found to have a smaller muscle mass than controls kept at 30° C. Protein and water determinations revealed this to

be due to reduced protein deposition and not to differences in water content only. Apparently red and white muscle fibers as well as connective tissue, are affected.

Variations in air temperature and atmospheric pressure in the Atlantic sector of the Arctic are discussed on the basis of data from five stations established north of 70° N. lat. by the Norwegian Meteorological Institute, viz: Spitsbergen (established in 1912), Jan Mayen (1920), Bjørnøya (1921), Myggbukta (1922), and Hopen (1946). Map locates these and other synoptic stations north of 70° N. reporting in Jan. 1956. An analysis of the mean temperature for the different seasons shows an increase at all stations with the greatest increase in the winter. Some results of this have been a retreating ice-front and improved fishing. Illus.

show the marked retreat of glaciers on Spitsbergen. An analysis of the changes in pressure distribution indicates increasing southwesterly winds and a retreat of the Arctic High to a more northerly position. ***Copy seen:*** DLC.

Describes installation at Point Barrow of two sets of electrodes to obtain earth-potential data for use in ionospheric studies. The first set, installed in a 6 x 6 ft. excavation down to permafrost (12 in. in Aug. 1955) was five untreated electrodes, which became useless during the winter with resistances increasing by several orders of magnitude as ground temperatures dropped, a pronounced increase occurring below 0° F. A second set, installed in summer 1956 with sodium chloride incorporated in the fill, proved practical for recording earth potentials, maintaining resistances of less than 5,000 ohms throughout the winter. ***Copy seen:*** CaMAI.

51709. HEUSSER, CALVIN JOHN, 1924– . Late Pleistocene environments and chronology of Pacific coastal Alaska. (Geological Society of America. Bulletin, Dec. 1958. v. 69, no. 12, pt. 2, p. 1753–54.)

Contains abstract of a paper presented at the Ninth Alaskan Science Conference at College, Sept. 3–5, 1958. Results are described of radio-carbon dating of basal and interbedded peats and pollen-peat stratigraphy of some fifty sections from Alexander Archipelago, Icy Cape, Prince William Sound and Katalla, Kenai Peninsula and Kodiak Island. Evidences of volcanism, glaciation and land-sea level changes are cited, and of the last, measurements and approximate dates are given. ***Copy seen:*** DGS.

This project completed its ninth year of glaciological and related studies during June 5–17 and Sept. 1–16, 1957. Five research objectives, and achievements in the fields of hydrological budget, surface movement, mapping, glacier variations, and photographic record by total of six participants, are briefly reported. ***Copy seen:*** DN–HO.

51711. HEUSSER, CALVIN JOHN, 1924– . Pleistocene and postglacial vegetation of Alaska and the Yukon Territory. (Biology Colloquium, 18th. 1957, p. 62–72, illus., sketch maps, graph.) Approx. 63 refs.

Reconstruction of vegetation sequences, based mostly on review of the literature (some unpublished) of pollen and spore stratigraphy of Alaskan and Yukon peats. In unglaciated areas in the interior and on the Pacific coast, plants appear to have survived two or more intervals of glaciation. From these areas of refuge, elements migrated during the postglacial, and probably interglacials, to repopulate territory previously occupied by glaciers. Pollen diagrams from the Brooks Range show a gradual influx of spruce until the close of the postglacial interval of maximum warmth. Forest development in southern, southwest and southeast Alaska is traced. ***Copy seen:*** DGS.

Memoir on this Norwegian writer 1902–1943, in particular his sojourns on Jan Mayen during two months in summer and for a short period in December 1942. Everyday life of the Norwegian garrison on the island is described; then the only Norwegian territory unoccupied by the Germans outside the Antarctic. A short introduction is contributed by Helge Ingstad. ***Copy seen:*** SPRI.

51732. HJORT, JOHAN, 1869–1948. Hydrografisk-biologiske studier over norske fiskerier. (Norske geografiske selskab. Årbok, 1894–1895, *pub.* 1895. v. 6, p. 127–46, 5 fold. col. maps.) Text in Norwegian. ***Title tr.:*** Hydrographic-biologic studies of Norwegian fisheries.

Annual periodicity of fish occurrence on the Norwegian coasts is discussed and variations are noted. Outer limits of the coastal banks are traced and differences

indicated between the fresh cold waters of the Baltic current which continues westward along the Norwegian coast, and the warmer saline ocean layers. In winter, the hydrology depends to some extent on meteorological conditions. Fishery research in Scandinavian waters indicates that fish approach the shore to spawn only in areas of the warmer water layers. In the fresher water the eggs, if left free, sink due to their specific weight. The cold Baltic current lacks the plankton necessary to feed fry of Norwegian coastal fish. Variations in salt content of the North Sea and adjacent waters over 2½ years are mapped. ***Copy seen:*** DLC.

Wennerberg; 3, Mikkaglaciären sommaren 1954, några iakttagelser och jämförelser med främst Tjågnorisglaciären, av G. Norling. (Geographica 1957. nr. 31, p. 48–90, illus., maps, tables, diagrs.) 23 refs. Text in Swedish. Summary in English. ***Title tr.:*** The Mikka glacier in Sarek: 1, On geographical research in the Sarek area, by F. Hjulström; 2, The Mikka glacier in the summer of 1946, by N. Boman and B. Wennerberg; 3, The Mikka glacier in the summer of 1954, some observations and comparisons, particularly with the Tjågnoris glacier, by G. Norberg.

Hjulström (p. 48–51) reviews research programs in the Sarek mountain region (67°27′ N. 17°40′ E.) of north Sweden. Its pioneer was Axel Hamberg who visited the area every year (except two) between 1895 and 1931 (No. 45405).

Boman and Wennerberg (p. 52–57) report that the Mikka glacier (67°25′ N. 17°42′ E.) receded 320 m. between 1913 and 1946 (measurements taken at the tip). At the tip an ice mass 80 m. thick has melted; 400 m. above the tip about 60 m. has melted. The glacier tongue and the moraines (the terminal moraines constitute four different lines) are described. The fast melting process is attributed to decreased precipitation during winter, autumn, and spring and higher temperatures in all seasons, especially summer.

Norling (p. 58–86) describes the glacier in detail, its greatest length about 4.5 km., lowest point about 935 m. above sea level. To the west of Sarektjåkko is a small glacial lake, an unusual feature in Swedish glaciers. The highest rate of movement in the middle of the glacier was 4.9 cm. in 24 hrs., a decrease of about 40% since 1895–97. The total recession 1913–1954 was 457 m., an average of 11 m./yr.; but since 1946 the glacier has receded 137 m., indicating an increase of about 50% in the rate of recession. The Tjågnoris glacier, about three km. east of Mikka, is 3 km. long, lowest point 1,150 m. above sea level; the total recession 1913–1954 was 210 m. and the rate, like Mikka's, had increased about 50%. Higher spring and autumn temperatures, by lengthening the ablation period, have been the important factor in the recession. ***Copy seen:*** CaMAI.

51734. HOAR, WILLIAM S., *and* **M. K. COTTLE.** Dietary fat and temperature tolerance of goldfish. (Canadian journal of zoology, Feb. 1952. v. 30, no. 1, p. 41–48, illus. table.) 7 refs.

Accounts of experiments, with low temperature down to 2.2°±0.3° C. No evidence was found of a relationship between the melting point of the dietary fats and resistance to cold. However, hydrogenation of the pilchard oil fed, reduces resistance to both low and high temperatures. ***Copy seen:*** DLC.

51737. HOCHBAUM, HANS ALBERT. Travels and traditions of waterfowl. Minneapolis, University of Minnesota Press, 1955. x, 301 p. illus., maps, tables. Approx. 450 refs.

A penetrating study of the ducks, geese and swans, their behavior and movements as observed at the Delta Waterfowl Research Station, Manitoba (of which author is director); migrations (p. 89–213); and their traditions, "behavior that is delivered by ancestors to progeny non genetically." The discussion of migrations, which has the most direct bearing on arctic areas and conditions, includes the southward migration of these birds from their breeding grounds and home, and their return in the spring; the influence of movements of air masses upon the migrations and ways of orientation, etc. The concept of tradition and its role in migration is analyzed in detail. An extensive bibliography, a list of common and Latin names of the birds studied, and a useful index are appended. Author's numerous drawings and diagrams embellish and elucidate the study.

Mean values of air pressure for the period 1901–1930 were computed. The barometric stations used (among them Karesuando, Jokkmokk, Haparanda, Piteå), annual and monthly means of air pressure for the years 1896–1930 for selected stations, monthly mean values for 1901–1930 reduced to 0° C. and normal gravity but not to sea level, and to sea level are tabulated. Other tables show quinquennial monthly means for the period 1866–1940, reduced to 0° C., normal gravity and sea level, and the difference between the mean pressure 1901–1930 and the pressure 1866–1895. Maps are drawn on the basis of these

values. Annual and secular variations 1866–1940 are given for some selected stations. ***Copy seen:*** DWB.

51742. HÖGBOM, ARVID GUSTAF. Nivåförändringarna i Norden; ett kapital ur den svenska naturforskningens historia. Göteborg, 1920. 163 p. fold. table. (Göteborgs k. vetenskaps- och vitterhets-samhälle. Handlingar, 1918–1919, 4. följden, häfte 21–22.) Refs. Text in Swedish. ***Title tr.:*** Changes of level in Fennoscandia; a chapter from the history of Swedish research in the natural sciences.

Reviews contributions to study of transgression and regression of the sea from 1694, Urban Hjärnes' discussion of the active process on the Swedish coast: the fact of recent submergence of dry tracts along the coast grew into a theory of diastrophism for the earth as a whole; Swedenborg (1710) expanded the geographic scope of the theory by relating it to Noah and the flood; Celsius, in 1724, attributed the apparent drop in sea level to a diminished water supply, his argument in contrast with earlier, concerned post-Glacial, largely historical time. Linnaeus related fossils and raised shorelines to changes of level.

Runeborg attempted to explain the changes as a result of deformation of the earth. C. Fr. Nordenskjöld in 1769 debated isostatic and eustatic changes. Kielhau in 1838 reported on changes of level in Norway, attributed by A. Bravais in 1842 to rise of the land. Eugène Robert (1844) recognized that relative rise of the land was greater in northern than in middle latitudes. Agassiz's glacial theory gave interpretation to erratic boulders, gravel deposits, glacial striae and other phenomena common to Scandinavia. Differentiation of Glacial and post-Glacial deposits, of supramarine and submarine deposits, and other local investigations added to knowledge of the Scandinavian landscape. Plant geography studies, and the advancement of geological theory are discussed with mention of other Scandinavian investigators and their works.

51750. HOFFMAN, ROGER A. Effect of LSD–25 on body temperature of pigeons. (American journal of physiology, Dec. 1958. v. 195, no. 3, p. 747–50, illus.) 12 refs.

Subcutaneous administration of this compound caused a temperature fall with a maximum in 1–2 hrs. and recovery by 4–6 hrs. Simultaneously O_2-consumption and heart rate decreased, while breathing rate increased greatly.

Copy seen: DNLM.

51751. HOFFMAN, ROGER A. Temperature response of the rat to action and interaction of chlorpromazine, reserpine and serotonin. (American journal of physiology, Dec. 1958. v. 195, no. 3, p. 755–58, illus.) 13 refs.

Account of experiments indicating that reserpine and chlorpromazine act by different mechanisms; "while reserpine and serotonin may act at similar sites, it is . . . apparent that different effector sites are differently affected as well, at least insofar as thermoregulation is concerned."

51752. HOFFMANN, ROBERT S. The meaning of the word "taiga." (Ecology, July, 1958. v. 39, no. 3, p. 540–41.) 16 refs.

Two meanings are attached to this term (of Russian origin) by western ecologists: the circumpolar coniferous forest zone which bounds the tundra on the south; and the ecotone between tundra and coniferous forest. Author is against restricting the term to an ecotone. He cites Russian sources to show the original and present-day meaning as the first cited above, and reviews other terms used for the ecotone. ***Copy seen:*** DLC.

51753. HOFMANN, WALTHER, 1920– . Bestimmung von Gletschergeschwindigkeiten aus Luftbildern. (Bildmessung und Luftbildwesen, Sept. 1, 1958. no. 3, p. 71–88, illus., tables, graph, diagrs.) 6 refs. Text in German. Sum-

mary in English and French. ***Title tr.:*** Determination of glacier velocities from aerial photographs.

"A method of aerial photogrammetry which permits measurement of glacier movement is described, and the results of tests in Greenland in July 1957 during preparatory work for the International Glaciological Expedition of 1957–1960 are reported. The method consists in measuring directly by stereoscopy the displacements on photographs taken during two independent flights. The measured values are reduced to pure motion parallaxes using a stereo model of the flight. The most suitable instruments for plotting are the Zeiss Aerophotograph Stereopret and Stereotope. The method proved satisfactory in Greenland in spite of poor photographic material. Data on the velocity of Kangigdleq and Sigssortartoq Glaciers are tabulated."—SIPRE.

Reports the continuation in 1956 of studies initiated by the author in 1952. Photogrammetric and trigonometric observation procedures are described briefly.

Copy seen: DLC.

51755. HOFMANN, WALTHER, 1920– . Die Internationale Glaziologische Grönland Expedition 1959/60. (Naturwissenschaftliche Rundschau, May 1958. Heft 5, p. 169–75, illus.) Ref. Text in German. ***Title tr.:*** The International Glaciological Greenland Expedition 1959/60.

Reviews organization, plans, and main objectives of this expedition to the central inland ice, the author in charge of geodetic work. The budget, state and dynamics of the icecap are to be studied: German scientists to carry out geophysical, meteorological, and geodetic work; Danes, geodetic and photometric measurements of the coasts; Austrians, radiation in the ablation zone; French, glaciology and hydrology of the ablation zone; and Swiss, glaciology of the icecap. A summer 1957 reconnaissance was made to determine access, station locations, routes, etc. General direction and technical arrangements are by the French.

51756. HOFMANN, WALTHER, 1920– . Lagemessungen bei der Internationalen Glaziologischen Grönland-Expedition (EGIG) 1959. (Zeitschrift für Vermessungswesen, July 1958. Jahrg. 83, Heft 7, p. 216–22, map, diagrs.) 7 refs. Text in German. ***Title tr.:*** Position measurements by the International Glaciological Greenland Expedition 1959.

Positions are to be determined with a horizontal accuracy of ± 2 m., vertical ± 1 m., along two base lines: one (820 km.) runs west-east from Umanak to Cecilia Nunatak, the other (300 km.) north-south some 100 km. from the western edge of the icecap. Aluminum tubes 10 m. long are to be used for markers, placed in 3-m.-deep bore-holes at 10 km. intervals. Height determinations along the west-east profile will be made by geometric levelling; along the north-south line, trigonometrically. Advantages and disadvantages of possible methods of position determination are discussed in detail; the favored method requires four weasels equipped with tellurometers to measure a chain of squares 10 by 10 km. while moving parallel at this distance along the base line (two at 10 km. distance from the line); the geometric figure, of which the weasels mark the four corners, will be maintained square through accurate navigation by compasses and kilometer-counters. Measurements are to be reduced and controlled upon completion of each square. Polygonometric measurements will be applied on the north-south profile and the eastern part of the west-east profile. ***Copy seen:*** DLC.

51757. HOFMANN, WALTHER, 1920– . Stand der Vorbereitungen zur Internationalen Glaziologischen Grönland-Expedition (EGIG) 1957–60. (Zeitschrift für Vermessungswesen, July 1958. Jahrg. 83, Heft 7, p. 235–36.) 6 refs. Text in German. ***Title tr.:*** Status of the preparations for the International Glaciological Greenland Expedition (EGIG) 1957–1960.

The main expedition, headed by P. É. Victor is to begin work in 1959 (Apr.–Sept.), the glaciologists and meteorologists wintering (1959–60) on the inland ice. Five national groups are to participate: Denmark (group: coastal geodesy) will undertake aerophotogrammetric sur-

veys of the glacier-tongues on the western edge of the inland ice at Disko and Umanaq Bays, also survey of Kangerdlugssuaq glacier. Germany (group: geodesy and geophysics, including meteorology) will carry out seismic, gravimetric, magnetometric and electric measurements of the inland ice for the determination of its thickness and density and exploration of the ground beneath the ice, also measurements of quadrilaterals and check points for the aerial survey on Kangerdlugssuaq glacier; the geodetic program covers measurements of position and altitude along two profiles within the zone of greatest glacial activity. France (group: hydrology and coastal glaciology) is responsible for the technical preparation, logistics, etc.; its hydrology groups will measure run-off and bathymetry in Kangerdlugssuaq Fjord, measure ablation and study structure of the marginal zone of the inland ice. The Swiss (glaciology) group will investigate the structure, physics, and chemistry of the firn and ice-bodies above the firn line. An Austrian expert on radiation measurements is to be with the coastal glaciology group. Group leaders and some participants are named.

(U.S. Quartermaster Research and Engineering Center. Environmental Protection Research Division. Research Study Report RER–23) 17 refs.

Furnishes information on topography, weather conditions, and accessibility of these two sites and of their adjacent icecap areas; and discusses their relative merits for testing equipment and for research purposes. Narsarssuak, in southwest Greenland, has easier year-round accessibility; is 1,200 miles closer to the United States; can be reached by large ships during any month, even in midwinter with icebreaker assistance. Its climatic conditions are warmer but stormier than Thule in northwest Greenland. Several hundred miles of ice-laden waters must be navigated to reach Thule during the brief shipping season, and in 1957 most supplies (six out of every seven tons) went there by ship. Access to the inland ice is less difficult from the Thule area; but Narsarssuak Air Base has a 47-mile approach road to the ice-cap.

Förhandlingar, 1957. bd. 79, häfte 3, no. 490, p. 291–528, 70 illus., 48 diagrs. 15 text maps, 7 plate maps.) 162 refs. Text in Swedish. Summary in English. ***Title tr.:*** The progress of deglaciation in the Torneträsk region after the latest glacial period, with certain backward glances and regional comparisons.

Disappearance of the ice after the most recent glacial period in this region of northern Sweden and Norway was investigated to clarify and describe the course of events. Erosional forms, glacial striae, till, morainal material, terraces, fluvial sediment and soil creep were examined with regard to relative age, effects of bedrock and topography, ice movement, stream direction, wind direction, precipitation, and recent changes. It is concluded that "the inland ice was no doubt ruled by the same physical laws as the recent glaciers, therefore its last remnants must have disappeared among the high mountains, as glacier ice does today." ***Copy seen:*** DGS.

Presents data and list of recoveries. Many specimens were banded or recovered in the northern regions of Scandinavia. During the year, 32,153 were ringed in Norway, bringing the total to 294,007. ***Copy seen:*** DI.

51770. HOLLAND, GEORGE P. Notes on the genus *Hystrichopsylla,* Rotschild in the New World, with descriptions of one new species and two new subspecies; Siphonaptera: Hystrichopsyllidae. (Canadian entomologist, July 1957. v. 89, no. 7, p. 309–324, 29 illus.) 4 refs. *Pub. also as:* Contrib. No. 3550, Entomol. Div., Science Service, Dept. of Agriculture, Ottawa, Canada.

Contains a discussion of the genus, a key to the nearctic species, and an annotated list of ten with localities and hosts for each. *H. dippie* subspecies (Ketchikan, Alaska) and *H. occidentalis* (various localities in western and southern Alaska) are included. ***Copy seen:*** DLC.

51771. HOLLAND, MICHAEL F. W., *d.* 1957. An expedition to West Greenland, 1956. (Geographical journal, Mar. 1958. v. 124, no. 1, p. 69–79, maps.) 6 refs.

Gives account of a five-man British expedition organized to continue the glaciological work of Oxford expeditions of 1935, 1936 and 1938 in the Sukkertoppen icecap region (approx. 66° N. 52°–52°30′ W.), to attempt the ascent of Mt. Atter from the south and to try to sledge up the Taterat glacier. The physiography of the area is described and results of glaciological and geomorphological studies summarized. Average annual accumulation on the south side of Mt. Atter showed slight decrease over an 11-yr. period, while at the head of Igdlo glacier accumulation increased significantly, 1948–1956. No evidence of great wastage above the firn line was found, while rocks and small moraines indicated some retreat of glacier fronts; that of Taterat Glacier was in the same position as in 1938. Relief above 1,200 m. elevation shows evidence of intense erosion by frost shattering aided by an abundant meltwater supply from above the firn line and debris transport by cirque glaciers, avalanches, or mass movement of ice. The party's equipment and food are discussed. Changed conditions of West Greenlanders are noted. Work of M. F. W. Holland and circumstances of his death in July 1957 while with a Danish IGY party in North Greenland are reported by Dr. B. Fristrup. ***Copy seen:*** DGS.

51772. HOLLAND, W. C., *and* R. L. KLEIN. Effects of temperature, Na and K concentration and quinidine on transmembrane flux of K^{42} and incidence of atrial fibrillation. (Circulation research, July 1958. v. 6, no. 4, p. 516–21, illus.) 6 refs.

Report on experiments with isolated rabbit atria which demonstrated *inter alia* that lowered temperature (14° to 29° C.) inhibits fibrillation and its associated flux changes. Decreased extracellular Na, or increased K or the presence of quinidine had similar effects. ***Copy seen:*** DLC.

51773. HOLLICK, CHARLES ARTHUR, 1857–1933, *and* N. L. BRITTON. *Cerastium arvense,* L., and its North American varieties. (Torrey Botanical Club. Bulletin, Mar. 1887, v. 14, no. 3, p. 45–51.)

Two of these chickweeds are northern varieties: *Cerastium arvense* var. *latifolium,* native to arctic regions of Europe, Asia, and North America (Labrador), also *C.a.* var. *fuegianum,* ranging from the Arctic to northern Pennsylvania and Utah. ***Copy seen:*** DLC.

51774. HOLLICK, CHARLES ARTHUR, 1857–1933. Descriptions of new species of Tertiary cycads, with a review of those previously recorded. (Torrey Botanical Club. Bulletin, Apr. 1932. v. 59, no. 4, p. 169–89, 14 plates.)

Describes: Ceratozamia wrightii, Dioön inopinus and *D. praespinulosum* n. spp., all found near the head of Hamilton Bay, Kupreanof Island, Alexander Archipelago, Alaska, in Tertiary formations; data are added on distribution of New and Old World Tertiary cycads. They "are of special interest as representing the last bid for life of the cycadophytes outside of the tropical and subtropical zones as now recognized." ***Copy seen:*** DLC.

51775. HOLLICK, CHARLES ARTHUR, 1857–1933. Former climatic conditions in Alaska as indicated by the Cretaceous and Tertiary floras. (New York Botanical Garden. Journal, 1913. v. 14, p. 210–13.)

Reviews collection of M. A. J. Collier from the Yukon valley, in 1902, and that in the Canadian Geological Survey from the Kootenay valley. Climatic conditions on the Pacific coast were, at least

as far as the Cretaceous Period, milder than those of the Interior; the Cretaceous and Tertiary floras of the coastal region were almost as different from the contemporaneous floras of the Interior as they are today. ***Copy seen:*** DA.

Summary in English. ***Title tr.:*** The Eocambrian beds below the hyolithus zone between Čarajavrre and Časkias, western Finnmark.

Investigations in 1956 reveal that the Cambrian tillite described in No. 45593 rests on older Eocambrian arkose beds. Total thickness of the Eocambrian beds is at least 5.5 m., probably considerably more. ***Copy seen:*** DGS.

51790. HOLMSEN, PER, 1911– , *and others*. The Precambrian geology of Vest-Finnmark, northern Norway. Oslo, H. Aschehoug, 1957. 107 p. illus., maps (2 fold.), diagrs., cross sections, 7 tables. (Norway. Geologiske undersøkelse. Publication, nr. 201.) 20 refs. Text in English. Summary in Norwegian. *Other authors:* P. Padget *and* E. Pehkonen.

The exposed geologic formations of a 5,000 km.^{2} Precambrian area in western Finnmark and southeastern Troms were provisionally mapped in 1954–55. A limited area around Caravarre consists of weakly metamorphosed rocks, the core of a series of roughly concentric zones of increasing thermal metamorphism culmi-

nating both east and westward in granitic rocks. To the north and northwest, shales of the Hyolithus zone (Caledonian) lie unconformably above the Precambrian. Comparisons are made with similar formations in northern Finland and Sweden, and resemblance to the regional metamorphism in the Scottish highlands and elsewhere is noted. Emphasis was placed on systematic bedrock mapping and the search for ore, especially sulphide deposits. Stratigraphic description is presented for eight sub-areas. The most significant finds of rocks and minerals of possible economic value are summarized.

51791. HOLMSGAARD, ERIK. Svenske årringsundersøgelser. (Norsk skogbruk, May 1957. årg. 3, nr. 10, p. 286–88, diagr.) 7 refs. Text in Danish. Summary in English. ***Title tr.:*** Swedish annual ring investigations.

Bo Eklund's work on the width of annual tree rings of pine and spruce in northern Sweden is reviewed and his methods are criticized. Ringwidth correlations with variations in temperature are believed to be emphasized over relationships with variations in precipitation. Records from scattered weather stations are believed to be less representative of actual precipitation than of temperature. Therefore the station precipitation data are less representative in such studies. ***Copy seen:*** DA.

51792. HOLT, OLAV, *and* **B. LANDMARK.** Some statistical properties of the signal fine structure in ionospheric scatter propagation. Oslo, H. Aschehoug, Mar. 1958. 7 p. diagrs. (Norske videnskaps-akademi i Oslo. Geofysiske publikasjoner, v. 20, no. 8.) 7 refs.

Analyzes recordings from an 1150 km. ionospheric scatter circuit Tromsø (70° N. 19° E.) Kjeller (60° N. 11° E.) on 46.8 mc./s. Probability distribution and maxima of signal envelope, and separation between successive maxima of signal envelope were obtained both for the background and the meteoric components. Statistical properties of the background component were found in agreement with those to be expected from Gaussian noise; i.e., the signal may be explained in terms of scattering from a large number of irregularities. Interference between a few reflected components (result of trail bending due to large scale wind gradients) may account for fading of enduring meteoric bursts. ***Copy seen:*** DGS.

HOLT, SIDNEY J., *see* Internationa Commission NW Atlantic Fisheries. Proceedings . . . 1957–58. *1958.* No. 51935.

51793. HOLTEDAHL, HANS. On the Norwegian continental terrace, primarily outside Møre-Romsdal: its geomorphology and sediments. With contribution on the Quaternary geology of adjacent land and on the bottom deposits of the Norwegian Sea. Bergen, Grieg, 1956. 209 p., illus., tables, diagrs., maps incl. 1 fold. (Bergen, Norway. Universitetet. Årbok 1955, naturvitenskapelig rekke, no. 14.) 184 refs.

Presents comprehensive study on submarine morphology of Norwegian continental shelf, here called continental terrace, based on sounding results, study of bottom sediments, and effects of glaciers during the last glacial age.

Studies were carried out (1951–54) and bottom sediments collected in the southern area of the Norwegian Sea between Iceland and Norway. The marine-geological, geomorphological work includes the continental terrace of northern Norway, the Barents Sea shelf and the west coast of Spitsbergen (p. 60), and the coastal area of East Greenland (p. 61). Basic submarine features, origin and development of the shelf, major fault lines, flexure zones, and tectonic movements are briefly characterized. ***Copy seen:*** DLC.

51794. HOLTEDAHL, HANS. A petrographical and mineralogical study of two high altitude soils from Trollheimen, Norway. (Norsk geologisk tidsskrift, 1953. bd. 32, hefte 2–4, p. 191–226, diagrs., graphs, maps, tables.) 40 refs.

Analyses of two soil columns on the summit plateau of Midtre Gjevilvasskamm in the Trollheimen region are described. Neither has a soil profile development. Each has coarser materials in the section above bedrock. Particle size and lack of stratification rule out accumulation by wind transport. Some chemical weathering is evident, but most of the disintegration is due to frost action. One is believed to be a residual soil, the other a till. They are thought to be no older than the Wisconsin glaciation.

51795. HOLTEDAHL, HANS. Some remarks on geomorphology of continental shelves off Norway, Labrador, and southeast Alaska. (Journal of geology, July 1958. v. 66, no. 4, p. 461–71,

5 maps, incl. 2 fold., diagr.) 24 refs. *Also pub. as:* California University. Scripps Institute of Oceanography, Contribution.

Marked topographical similarities are noted between these continental shelves. Longitudinal channels and transverse depressions, with common characteristics, are found off the Labrador and Southeast Alaska coasts; are believed to indicate that present land areas are bordered by major fracture zones, along which dislocations took place during the Cenozoic uplift. Areas discussed are: off Tromsø, Norway; between Nain and Domino Pt., between South Wolf Island and Strait of Belle Isle, Labrador; between Cross Sound and Yakutat Bay, Alaska.

51796. HOLTVED, ERIK, 1899– . Remarks on Eskimo semantics. (International Congress of Americanists, 32nd. Copenhagen, 1956. Proceedings, 1958. p. 617–23.) Refs. in text.

Analyzes the semantic system of the Eskimo language and its peculiar word formation. Word stems representing concepts of nominal or verbal character are used either independently or as suffixes and express an idea, i.e., sentence, rather than a single word. The difficulties of translating these word-sentences are discussed: a more exhaustive study of Eskimo primary stems is required for comparative linguistic analysès.

51801. HONIGMANN, JOHN JOSEPH, 1914– , *and* **R. N. CARRERA.** Cross-cultural use of Machover's figure drawing test. (American anthropologist, Aug. 1957. v. 59, no. 4, p. 650–54.) 12 refs.

Reports on procedure, interpretation and results of a comparative human figure drawing test conducted among a group of Eskimo children at Great Whale River in northern Quebec, 1950, and Cree children at Attawapiskat, northern Ontario, in 1955. The tested Eskimos (boys aged 8–13, girls 12–14) showed better adjustment and less sexual conflict than did the Indians. The lower I.Q. of the Eskimos, based on the Goodenough "Draw a man test," is attributed to their poorer drawing skill. The Machover technique appears to have little value for anthrcpological field study. ***Copy seen:*** DLC.

51802. HOOD, JOHN M., Jr., *and* **W. H. HODGSON.** Marker flag visibility in the polar regions. San Diego, Sept. 8, 1958. 5 p., 2 graphs, 3 tables. (U.S. Navy Electronics Laboratory, NEL letter report no. 45.) 3 refs.

Presents information on the visibility ranges of five different flag materials, as seen under three general lighting conditions. Two of the materials were dyed with fluorescent yellow and red; the other three were standard red, yellow, and black bunting. Calculations of visibility range were made for three conditions of haze; namely 1, 5, and 25 miles " meteorological range," and under each of three illumination and viewing situations. Visibility ranges were calculated through the use of special nomographs; based on data obtained in the spring of 1957 at Pt. Barrow, Alaska, and on field measurements made at the U.S. Navy Electronics Laboratory, San Diego. Method of calculation is described; results of measurements and computations are presented, with discussion and conclusions. Black bunting gave the best visibility ranges in all but one case; red fluorescent material may have value under conditions not considered. Color fading, wind conditions should be considered. Actual field measurements are to be made at the Arctic Research Laboratory, Pt. Barrow.

Contains a critical revision of the beetles of this tribe with characteristics of the tribe, generic synonymy, generic and specific keys; and a systematic list of 55 species, descriptions, synonyms, critical notes and data on host plants and geographic distribution. *Xylotrechus undulatus* from Alaska (p. 536–38) is included. Part II of this paper does not contain arctic species. ***Copy seen:*** DSI.

51808. HORI, TAKEO. On the supercooling and evaporation of thin water films, 1; (Teion kagaku, 1956. ser. A, v. 15, p. 33–42, illus.) Text in Japanese. Summary in English.

Laboratory studies with thin films of water sandwiched between glass or quartz plates and cooled to −100° C. are reported, and the experimental procedure and apparatus used are described. The degree of supercooling showed a tendency to increase with decreasing film thickness and was independent of volume or interface area. Vapor pressure in equilibrium with a water film of a certain thickness was approximately equal to the saturation vapor pressure of bulk water; it fell more or less rapidly with decreasing film thickness to reach zero pressure at a limiting thickness. Sufficiently thin films of water, held between solid surfaces, acquired a high rigidity without crystallizing and exhibited a high resistance both to freezing and evaporation. ***Copy seen:*** DWB.

(U.S. Geological Survey. Bulletin 1058–A. Mineral resources of Alaska.) 17 refs. *Other authors:* R. G. Bates, R. S. Velikanje, *and* H. Wedow, *Jr.*

Three localities were surveyed: northern Prince of Wales Island and parts of adjacent islands; the Taku Harbor-Point Astley district (approx. 58° N. 134° W.), and the Hyder area. Work was done on behalf of the U.S. Atomic Energy Commission. Significant concentrations of radioactive minerals (carbonate-hematite veins) were found only near Salmon Bay (approx. 56°20′ N. 133°10′ W.) on northeast Prince of Wales Island. Minerals present in these veins are identified; radioactivity is mostly due to thorium; data are tabulated; seven surface samples assayed 0.034% equivalent uranium or 0.16% equivalent thorium; it appears unlikely that richer deposits lie at greater depths. Samples from the two other areas studied are also reported; little or no radioactivity was noted.

51831. HOWELL, LYNN GORMAN, 1905– , *and* **J. D. MARTINEZ.** Polar movement as indicated by rock magnetism. (Geophysics, Apr. 1957. v. 22, no. 2, p. 384–97, diagrs. 5 maps, photo.) 18 refs.

Measurements of remanent magnetism have been carried out by geophysicists in the United States and England in a broad sampling of Paleozoic sediments. The direction of magnetization of these rocks indicates that the positions of the earth's magnetic poles were quite different in Paleozoic times from their positions today. Since the magnetic poles are thought to be connected with the spin axis of the earth, the locations of the magnetic poles, as averaged over space and time, should indicate the locations of the geographic poles. Based on paleomagnetic data obtained by several observers, maps are shown locating the magnetic poles during the Carboniferous, Cambrian, Triassic-Permian, and Paleozoic times. ***Copy seen:*** DLC.

51832. HOWELL, THOMAS, 1842–1912. A rearrangement of American Portulaceae. (Erythea, Feb. 1893. v. 1, no. 2, p. 29–41.)

A critical revision of 65 American species of this herb family, based on a number of characters of the fruit structure, and matters of habit. *Claytonia arctica* (Alaskan coasts and islands), *Montia chamissonis* (Alaska to California), and *M. asarifolia* (high mountains from Alaska to California), are included.

In cold-adapted, curarized rats exposed to cold, the calorigenic effect of adrenaline and noradrenaline was enhanced. On the other hand the hydrochlorides of hexamethonium and of piperoxane prevented an increase of O_2-consumption under similar conditions.

Copy seen: DLC.

51835. HSIEH, ARNOLD C. L., *and* L. D. CARLSON. Role of the thyroid in metabolic response to low temperature. (American journal of physiology, Jan. 1957. v. 188, no. 1, p. 40–44, illus.) 29 refs.

Account of experiments with cold- and heat-adapted rats, exposed to cold (or heat) before and following thyroidectomy. O_2-consumption, heart rate, muscle activity, rectal and surface temperatures were recorded. It was found that thyroxin stores were utilized twice as fast by the cold acclimatized rats. Upon exposure to cold, the rats increased their oxygen consumption and continued so after depletion of the thyroxin reserves, which indicates that the metabolic response to cold is not directly dependent upon the quantity of circulating thyroxin.

51838. HUBLEY, RICHARD CARLETON, 1926–1957. An analysis of surface energy during the ablation season on Lemon Creek Glacier, Alaska. (American Geophysical Union. Transactions, Feb. 1957. v. 31, no. 1, p. 68–85, tables, graphs.) 31 refs.

Data collected in summers of 1953–54 at a micrometeorological station on this

511326—60——33

glacier in the Juneau Ice Field (58°24′ N. 134°34′ W.) at approx. 4,000 ft., were used in an empirical investigation of the energy transfer at an isothermal, melting snow surface and its relationship to observed meteorological parameters; more refined instrumentation and methods of observation were available than in earlier, similar investigations by H. U. Sverdrup (No. 17287, 17305) and C. C. Wallén (No. 19095). Diurnal net radiation transfer to a level snow surface on cloudy days was generally found to be greater than when skies were clear. Heat transfer by rainfall was found insignificant except when the snow temperature was below freezing. The most important factor causing ablation was turbulent heat transfer, the rate of which was almost invariably related to windspeed and vertical temperature distribution above the surface. ***Copy seen:*** DLC.

51839. HUBLEY, RICHARD CARLETON, 1926–1957. IGY research program on McCall Glacier, Brooks Range, Alaska. (Geological Society of America. Bulletin, Dec. 1957. v. 68, no. 12, pt. 2, p. 1906.)

Abstract of paper presented at the Eighth Alaskan Science Conference in Anchorage, Sept. 10–13, 1957. Describes geophysical research program, May 1957–Sept. 1958, on a typical glacier of the Romanzof Mts. of the eastern Brooks Range, including micrometeorology, snow and ice stratigraphy, glacier movement, and thermal structure within the glacier. The small, alpine-valley type glaciers of this area have not shrunk in the last several decades like other Alaskan glaciers, possibly because, being thermally polar, they may respond differently to climatic changes than the predominating thermally temperate glaciers.

51846. HUMMEL, C. L. Bedrock geology of an area near Nome, Alaska. (Geological Society of America. Bulletin, Dec. 1958. v. 69, no. 12, pt. 2, p. 1730.) Abstract of a paper presented at the Society meeting in Golden, Colorado, May 8–10, 1958.

Describes bedrock deformed during at least two orogenies in an area extending about 15 mi. east and 35 mi. north of Nome. ***Copy seen:*** DGS.

51847. HUMMEL, C. L. Geology of the bedrock and lodes of the Nome gold fields, Alaska. (Geological Society of America. Bulletin, Dec. 1958. v. 69, no. 12, pt. 2, p. 1754.) Abstract of a paper presented at the Ninth Alaskan Science Conference at College, Sept. 3–5, 1958.

Field investigations in an area 15 mi. wide extending 35 mi. north of Nome are described. Most of the bedrock is quartzose and calcareous schist and interbedded marble of sedimentary origin; nearly all of it has been regionally metamorphosed. Two orogenies occurred, the later, probably in Tertiary times, giving rise to the Kigluaik Mts. Most of the lode deposits are of base-metals with gold and scheelite as minor constituents. Many are high grade, but too small to be of economic importance. Pegmatites and metasedimentary graphite deposits in the Kigluaik Mts. have no present economic value.

51851. HUMPHRYS, GRAHAM. The railway stimulus in Labrador-Ungava. (Geography, Apr. 1957. v. 42, pt. 2, no. 196, p. 117–19, text map.)

The Quebec North Shore & Labrador Railway moved 12 million tons of iron ore in 1956; its maximum capacity will be 20 million tons. This railroad has stimulated further exploration for orebodies, as at Wabush Lake, 200 mi. north of Seven Islands and 30 mi. west of the railway. A road is being built by the British Newfoundland Corp. from the railway eastward to Grand Falls on the Hamilton River, a potential hydroelectric power source. Schefferville, the northern rail terminus and primarily an iron-mining town, is on the Mid-Canada defense radar line. Men and construction material for radar sites have increased the railway's freight volume, also the average monthly aircraft landings from 170 to over 850. ***Copy seen:*** DGS.

51852. HUMPHRYS, GRAHAM. Schefferville, Quebec: a new pioneering town. (Geographical review, Apr. 1958. v. 48, no. 2, p. 151–66, plates, 2 text maps.) 2 refs.

Description, with location map, town plan, and numerous photos, of this company town (Iron Ore Co. of Canada) near the recently developed mines at Knob Lake. It is the terminus of the new Quebec North Shore and Labrador Railway; its airport (two scheduled lines) is control center of the eastern arm of the Mid-Canada Defence Line. The McGill Sub-Arctic Research Laboratory carries on research in seismology, ionospheric physics, snow and ice, geomorphology, vegetation and agriculture in the area. A factor in future planning of this settlement is its distance (30 miles) from large low-grade iron ore deposits not yet developed. A new town may be required. Inadequacy of original site, shortage of housing, uncertain future in mining are also factors. Schefferville is not a "pioneer" town, but rather an outlier of civilization, maintained by the need for iron. ***Copy seen:*** DGS.

51853. HUNT, J. B. Brittle fracture of mild steel in torsion. (Engineering, Aug. 9, 1957. v. 184, no. 4770, p. 173–74, diagrs., graphs, tables.)

"Impact tests were made on mild-steel specimens in torsion at low temperatures to study the variation in stress-strain characteristics as brittle fracture conditions are approached (test range −100° to −195° C.). It was found that a uniform elasto-plastic twist existed and that this twist became a maximum when the overall ductility began to decrease. Torque-twist curves with a negative slope after yield were obtained."—Author's abstract. ***Copy seen:*** DLC.

51854. HUNT, JOHN CLARK. Burning Alaska. (American forests, Aug. 1958. v. 64, no. 8, p. 12–15, 40–42, illus., map.)

Includes information on the forest area of Alaska (225 million acres), the damage of the great forest fire of 1957; local causes of forest fires; fire control services. Earlier large fires and their causes, special difficulties of control in Alaska and economic aspects are discussed, plans for additional protection are outlined.

51862. HUSTICH, ILMARI, 1911– . Hudson Bay's subarktiska lågland. (Nordenskiöld-samfundet. Tidskrift, 1957. årg. 17, p. 45–62, illus., maps.) Text in Swedish. ***Title tr.:*** Hudson Bay's subarctic lowlands.

Contains a general geographical description of the coastal area west of Hudson and James Bays, visited by the author in 1956 with a Canadian forestry and phytogeographical expedition. Flights over the area and many local excursions were made as reconnaissance for a research project started by A. E. Porsild and planned to last for three to four years. Finnish and Russian scientists who have dealt with similar areas in their own countries are mentioned. Efforts to create economic opportunities for local inhabitants (2,000–3,000 individuals) are noted. ***Copy seen:*** DLC.

51863. HUTCHINSON, RICHARD W. Regional zonation of pegmatites near Ross Lake, District of Mackenzie, Northwest Territories. Ottawa, Queen's Printer, 1955. 50 p. plates, maps (7 fold.) tables. (Canada. Geological Survey. Bulletin 34.) 47 refs.

Report of a detailed field (approx. 62°40′ N. 113° W.) and laboratory study, begun summer 1952. Regional distribution and mineralogic characteristics of these rocks are described in detail, and a genetic relationship between them and the (Redout Lake) granite mass to the east is suggested. Pegmatite bodies examined (350) are described and referred by number to base map which shows their location, size and shape, and occurrence of certain rare-element minerals. Six typical bodies were mapped in detail by plane table methods. In the laboratory, thin section examination, X-ray diffraction work, preparation of grain mounts of plagioclase feldspar and their study by the colored Becke line method, spectrographic analysis and heavy mineral separation were employed. Among conclusions reached: nature of the pegmatite bodies varies systematically with increasing distance from the Redout Lake granite mass; all the pegmatites in the area were derived directly or indirectly from the granite, outward migration down a temperature-pressure gradient was responsible for the progressive changes in the resulting pegmatite bodies; concentrations of the rare-element minerals are not likely to be found in pegmatites within one mile of the Redout Lake granite. ***Copy seen:*** DGS.

Handbook, designed to advise the prospector on what industrial minerals to seek, and where; what discoveries to stake, to merely note, or to ignore. Characteristics of most common minerals are listed; potential buyers are indicated. ***Copy seen:*** DGS.

HUUS, JOHAN, 1892–1947, *see* Føyn, B., *and* J. Huus. Norges dyreliv. *1947–50.* No. 50939.

51865. HUZIOKA, TOSIO. A study on the running of a caterpillar snow car. (Teion kagaku, 1956. ser. A, v. 15, p. 93–100, illus., table.) 4 refs. Text in Japanese. Summary in English.

Measurements of the ruts made by the vehicle weighing 2,460 kg. at speeds from 1.5–30 km./hr. showed no decrease in depth with increasing speed as formerly reported. The ruts were uniformly 8.5 cm. deep at a speed of 1.5 km./hr., the depth of the compressed layer being 16 cm., while at higher speeds depth varied from 9–12 cm. and the compressed layer was 14–22 cm. deep. The lack of correspondence between rut depth and vehicle speed is attributable to the fragility of the snow, which was an aggregate of hoar crystals.

51866. HVALRÅDET. International whaling statistics. Edited by the Com-

mittee on Whaling Statistics. Oslo, 1930—*in progress.*

Issued annually since 1950 in 2 parts of approx. 80 pages each (in earlier years issued irregularly), one part covering the antarctic season; the other, whaling grounds outside the Antarctic. The latter include among other areas, West Greenland, Newfoundland, Kamchatka. A summary, in perspective, of the year's results is followed by tabular data on number and kind of whales killed in various areas, and by various countries, average size, foetus measurements, oil and sperm-oil production. Texts of documents are included occasionally, as in v. 30 *pub.* 1953, International convention for the regulation of whaling 2 Dec. 1946, schedule as amended to 1952.

51867. HVARFNER, HARALD. Fjäl-land, skogsland, kustland; om norrländskt stenåldersliv från sommar till vinter. (Norrbotten. Norrbottens läns hembygdsförening. Årsbok 1958, p. 25–35, illus., map.) 11 refs. Text in Swedish. ***Title tr.:*** Mountain, forest, coast; stone age life in Norrland from summer to winter.

Extensive archeological investigations carried out in north Sweden over the years, since 1942 by Riksantikvarieämbetet (Office of the State Antiquarian), disclose a stone age (shale and quartzite) culture not yet possible to date. Indications are found of a continuance into the Middle Ages and of its existence concurrently with a metal culture. The sites, whether by Lapps or others, are located along water-courses and are of two types according to the (mountain or forest) location. The sites on mountain streams submerged during part of the year, and temporary in character, rarely have distinct culture-layers. The forest region sites with thick culture-layers, seem to have been used intensively and are of a permanent type. Sites of both regions may have been used by the same people according to season.

51882. ÎAKOVLEV, GURIÏ NIKOLAEVICH. Ispytanie muzhestva; dnevnik polûrnika. Moskva, Gos. izd-vo geogr. lit-ry, 1957. 262 p. illus., plans (1 fold.), map. Text in Russian. ***Title tr.:*** A test of courage; a polar worker's diary.

Narrative of life, work and events on the Soviet drifting station North Pole-2, 1950–51 by its glaciologist. The station, headed by M. M. Somov, was set up Apr. 1, 1950, on an ice floe at 76°02′ N. 193°30′ E., and ÎAkovlev arrived on Apr. 7th. He describes the organization of the camp, transportation (by air and dog-team), camp life (tents, bath-house, meal preparation, fresh-water supply, etc.); visits of polar bears; scientific observations; struggle with melt water in summer; destruction of the radiostation by fire (p. 112). The station, originally occupied for six months, was continued to a full year; winter equipment and supplies were flown in, Oct. 26–Nov. 4. Technique of landing in polar night (p. 171–79), protection of the tents by outer snow walls, difficulties of winter observations, destruction of the floe by cracking and pressure, and transfer of the camp to another site in February (p. 208–233) are described. The station was evacuated at 81°45′ N. 196°12′ E. on Apr. 9–12, 1951. The members of the party (16, Apr.–Oct., 11, Oct.–Apr.) are characterized; station location, ice and weather conditions are stated throughout the drift. The camp was sighted again in 1954 and visited by a helicopter party from drifting station North Pole-4 (p. 255–61). The tents were found intact upon columns of ice, which thus protected from summer melt stood man high above the surface of the ice floe; the floe itself was of the same thickness (3 m.) as in 1951. ***Copy seen:*** DLC.

51883. ÎAKOVLEV, GURIÏ NIKOLAEVICH. Solar radiation as the chief component of the heat balance of the arctic ice. (*In:* Arctic Sea Ice Conference. Proceedings, 1958. p. 181–84, 3 tables.) 4 refs.

The role of radiative processes in the thermal balance of an ice sheet in the central Arctic Basin is examined on the basis of studies on drift station North Pole-2. Heat from direct radiation does not contribute much to the total supply of heat to the ice. The main portion of the incoming solar energy is derived from dispersed radiation. A stable transition to a positive daily radiation balance occurs in early May, reaching a maximum in June and July. Daily radiation balance begins to decrease in early Aug., the transition to negative sums begins in mid-Sept. and in Oct. a stable negative balance sets in. Maximum negative values were observed in mid-Feb. 1951 and the end of Dec. 1950. The maximum monthly radiation-balance value recorded was 3.5 kg-cal./cm.^{2} in

June and 3.7 kg.-cal. in July. In spite of the fact that the annual radiation balance sum is small, it predominates over other components of the thermal balance in months when the income of solar energy and radiation from the ice surface are most active.—From SIPRE.

(Problemy Arktiki, sbornik statei, 1957. vyp. 2, p. 193–204, diagrs., tables.) 5 refs. Text in Russian. Translated into English for the Geophysics Research Directorate, Cambridge Research Center, U.S. Air Force, by the American Meteorological Society. ***Title tr.:*** Turbulent heat exchange between ice cover and air in the Central Arctic.

Presents results of analysis of data on ice and air temperature and on near-surface wind collected by the drifting station North Pole-2 in 1950–51. A. R. Konstantinov's empirical formula for computing heat exchange caused by wind was applied and the heat current found to move from ice to air during May–Sept. and from air to ice in Oct.–April. Detailed data on amount of the turbulent heat exchange are given (tables 1 and 2), and compared with similar data for Turukhansk (66° N. 88° E.) and with data on radiation heat exchange in the Central Arctic, direction of which is opposite to that of turbulent heat exchange: down in summer and up in winter. The annual balance of turbulent heat exchange approaches 7 kg.-cal./cm.^{2}; radiation heat exchange amounts to 21 kg.-cal./cm.^{2}. ***Copy seen:*** DLC.

Trudy, 1958. t. 14, p. 140–48.) Text in Russian. ***Title tr.:*** The work of the Permafrost Engineering Section of the

Seventh Interdepartmental Conference on Permafrostology.

Subjects discussed at this conference in March 1956 include: construction problems, advances in practical and scientific fields, deficiencies and methods of correcting them. Progress in the design and construction of heated buildings on permafrost was recognized and certain failures were attributed to unfavorable natural conditions or inadequate planning. Investigations on tangential stresses between a foundation and frozen ground showed that maximum stresses develop near the permafrost boundary and decrease with distance from it. Good results were reported with prefabricated reinforced concrete foundations. A new technique for setting piles in frozen ground by blasting and a method of repairing deformed foundations were recommended. Pipeline construction was discussed and a method of determining heat losses of metal pipes was described. The exploitation of natural resources in permafrost, construction of hydraulic installations, and transportation problems were considered. The need for more extensive investigations in road and airfield construction was emphasized—From SIPRE.

Ichinskiy Volcano (approx. 55°42′ N. 157°35′ E.), the highest point (3,621 m.) in western Kamchatka, was ascended Aug. 1956 by four alpinists, including the author. Considered extinct, the volcano disclosed an active fumarole on the ice-covered slope about 2,900 m., but no sign of activity in the crater at the summit. ***Copy seen:*** DLC.

51905. ÎATSUN, EVGENIĬ PAVLOVICH. Na l'dine cherez polîus; zapiski kinooperatora. Moskva, Molodaîa gvardiîa, 1957. 252 p. illus., map. Text in Russian. ***Title tr.:*** Across the North Pole on an ice floe; a cameraman's notebook.

Popular account of life and work on the drifting station North Pole-3 from the time it was set up, Apr. 9, 1954, till its abandonment more than a year later. He recounts the flight over the Arctic Basin, choosing the floe and establishing the station at 86° N. 175°45′ W. The personnel and its accommodation in tents and knock-down huts, the scientific observations and daily routine of work, food, entertainment, visiting wildlife, etc., are described. Local hops (with helicopter) for hydrological work, the drift

(Aug.–Sept.) in the vicinity of the North Pole, the struggle with melt-water in summer and with cracks and ice pressure in winter, transfer of the camp, storms and blizzards, etc. are chronicled, till the evacuation of the station by air on Apr. 20, 1955 at 85°59′ N. 31°42′ W. Each of the 22-man team, five of them veterans of the North Pole-2 drift of 1950–51, is characterized with notes on his previous arctic experience and training. Five sick men (p. 188) were replaced by relief personnel during the winter. Many events of the drift are related in humorous detail, e.g., the vegetable-growing experiments, the acquisition of a 240 kg. piano, etc. The text is amplified by some fifty photographs.

51906. ÎAVNEL', A. A. Meteoritnoe veshchestvo s mesta padeniîa Tungusskogo meteorita. (Astronomicheskiĭ zhurnal, Sept.–Oct. 1957. t. 34, no. 5, p. 794–96, plate.) 7 refs. Text in Russian. Summary in English. ***Title tr.:*** Meteoritic matter at the site of the Tunguska meteorite.

Soil samples taken in 1927–30 by L. A. Kulik on the site of the Podkamennaya Tunguska meteorite were studied and two kinds of small metallic particles and magnetite (?) globules were found by microscope. Spectral analysis disclosed that the particles are composed of nickel-iron: the magnetite globules were blown out of the meteorite's surface during flight, and nickel-iron particles were formed by the explosion and evaporation on its fall. Similar metallic particles have been found at other such sites.

Prepared by the members of the faculty and staff of Indiana University's Graduate Program in Uralic and Asian Studies. Author: Alo Raun.

Deals with the ethnographic, sociological, political and economic aspects of the Ob'-Ugrian peoples. Their racial origin, distribution, language, religious beliefs, social organization, hunting and fishing economy, etc., are described. Their strong acculturation and submission to Soviet rule are stressed, and their economic and political potentials discussed. Sources are cited at end of each chapter, an extensive bibliography appended and some of the listed publications reviewed. ***Copy seen:*** DLC.

51922. INDIANA. UNIVERSITY. *Graduate Program in Uralic and Asian Studies.* The Samoyed. New Haven, Printed by Human Relations Area Files, 1955. xiii, 225 p. tables, maps. (Human Relations Area Files, Inc. Subcontractor's monograph, HRAF–13.) Approx. 50 refs. Prepared by the members of the faculty and staff of Indiana University's Graduate Program in Uralic and Asian Studies. Author: Igor Kopytoff.

Reviews the history and geographic distribution of the Samoyeds (Nentsy, Sel'kupy, Entsy and Nganasans) living mainly in the Nenets, Yamal-Nenets and Taymyr National Districts. Vital statistics based mostly on 1926 data, are given in detail. Languages, pre- and post-Revolutionary social organization and clan system, collectivization and resettlement, acculturation, administration, etc., are dealt with in turn. Education, religious beliefs, folklore, living and working conditions are described, with selected statistical information of 1940–1954 on income, kolkhoz wages, etc. The forced labor camps within and bordering on the three National Districts are discussed. Maps showing population concentrations, transportation network, radio and meteorological polar stations, mineral resources and agricultural experimental stations are appended.

Copy seen: DLC.

51923. INDIANA. UNIVERSITY. *Graduate Program in Uralic and Asian Studies.* The Zyryans (Komi). New Haven, Printed by Human Relations Area Files, 1955. xiv, 157 p. table, maps. (Human Relations Area Files, Inc.

Subcontractor's monograph, HRAF–8b.) Approx. 40 refs. Prepared by the members of the faculty and staff of Indiana University's Graduate Program in Uralic and Asian Studies. Authors: Joseph Strmecki and others.

A handbook dealing primarily with sociological problems. The history, ethnic composition, language, social conditions, religion, education, economy, acculturation, etc., are reviewed. Forced labor camps, especially in the Vorkuta area, are discussed and estimated 1954 statistics for the Vorkuta camps given: approx. 105,000 inmates and 120,000 freed prisoners restricted to the area. Maps showing the distribution of population, political division, agricultural and industrial areas, and dialects of the Komi language are appended.

Contains four parts, the first (p. 5–9) an administrative report by E. M. Poulsen on Germany's joining the Commission, officers, panel membership, publications, international cooperation; research and statistics, etc.; a financial statement is appended. The seventh annual meeting, May 20–25, 1957 is reported by T. de Almeida (p. 9–21): participants, agenda, publicity, budget and finances, research and statistics, panel meetings, etc. In pt. 3, summaries of research 1956 are presented by countries, viz:

Canadian research (p. 21–27) reported by W. Templeman and W. R. Martin dealt with hydrography and plankton, haddock, redfish, cod of Labrador Sea, Grand Banks, etc.

Danish research in West Greenland waters (p. 28–36) included distribution of cod eggs, fry and young; its age composition, tagging, etc., also redfish and wolffish, reported by P. M. Hansen; and hydrographic conditions, by F. Hermann.

French research: hydrographic sections and gear experiments on the Grand Banks of Newfoundland, is noted (p. 36) by J. Furnestin.

German research, as outlined by A. Bückmann and A. Meyer (p. 37–39), dealt with age composition of German

catches in West, South and East Greenland waters, fishing and spawning grounds, cod growth, etc.

Icelandic research off West Greenland is reported (p. 39–41) by: J. Jónsson on cod, age distribution of catches, growth, stocks, etc.; and J. Magnússon on redfish, catches, size distribution.

The Norwegian research report by B. Rasmussen (p. 41–48) covers fisheries of the West Greenland banks, hydrography, long-line fishery; bottom, pelagic, and hand-line fishery; purse-seining for cod; tagging and migration of cod; tagging of halibut.

Portuguese research as reported by M. Ruivo (p. 48–57) dealt with study of samples of commercial fisheries in West Greenland and Labrador waters, viz: cod-age and size distribution, growth, sex ratios, maturity, weight and size composition, etc.

Spanish researches were carried out on the Grand Bank; Dr. A. Rojo explains (p. 58–63) areas and size of fishery, size distribution of cod, its growth rate, age and sex distribution, food, etc., with similar data on haddock.

United Kingdom research report (p. 62–63) by C. E. Lucas and R. W. Wimpenny covers landings of cod, etc., by English trawlers.

United States research as reported (p. 63–68) by H. W. Graham, dealt with haddock, redfish, cod, hake, flounder; their biology, growth, size and age composition in catches, food, etc.; also hydrography in the Convention area. An appendix by R. Livingstone, Jr., deals with conversion values of total length to fork length in haddock.

Data of the various countries' research are summarized according to the Convention's sub-areas by E. M. Poulsen (p. 68–74). Scientists and laboratories of the 11 countries engaged in the Commission's activities are listed as pt. 4 of the year's proceedings.

51935. INTERNATIONAL COMMISSION FOR THE NORTHWEST ATLANTIC FISHERIES. Annual proceedings, v. 8, for the year 1957–58. Halifax, N.S., the Commission, Forrest Building, 1958. 104 p. illus., tables, maps.

Contains four parts: Administrative report and financial statement (p. 5–9) by E. M. Poulsen on: Soviets joining the Commission, officers and personnel, newsletters and publications, panel membership, international cooperation, research, statistics, meetings, finances, etc. Pt. 2, report on the eighth annual meeting, June 9–14, 1958, by K. Sunnanå (p. 10–19) includes information on participants, agenda, budget, finance and administration; research techniques, statistics; meetings, etc. Pt. 3, summaries of research 1957 are presented by countries and subareas, viz:

Canadian research (p. 19–26) by W. Tempelman and W. R. Martin, dealing with redfish, haddock, cod, flatfishes, hydrography, tagging experiments, fishing methods, fish stocks, etc.

Danish research by P. M. Hansen (p. 27–38) on cod off West and East Greenland, redfish, spotted wolffish and cod-tagging in the same area. Hydrography of the eastern Labrador Sea and Davis Strait is covered by F. Hermann.

French research is summarized by J. Ancellin (p. 38).

German research, by J. Lundbeck and others (p. 39–42), includes a study of redfish, net selection, age composition of cod catches, etc.

Icelandic research, by J. Jónsson (p. 42–45), deals with age and length distribution of cod, age and sexual maturity, catches and bottom temperatures.

Norwegian research, by B. Rasmussen (p. 45–51), covers the hand-line fishery off West Greenland, physical conditions, cod investigations and tagging, tagging of halibut.

Portuguese research, by M. Ruivo and G. Quartin (p. 52–60), deals with the age and size composition of cod, growth in males and females, sexual development, organ weight, etc.

Spanish research, by A. Rojo (p. 61–73), concerns size and age distribution of cod, feeding, sex ratio, biometry, fish discarded, trawling studies; also haddock and pollock investigations, including size distribution, growth, etc.

USSR. research in recent years, reported by Ю. Ю. Marti (p. 73–74) deals mainly with redfish search and fishery 1954–1957 in the Grand Bank, Flemish Cap areas.

United Kingdom report, by C. E. Lucas and R. S. Wimpenny (p. 75), notes commercial fishing, sampling at markets and at sea, etc.

United States research as reported by H. W. Graham (p. 75–77) deals with tagging experiments, control; stocks of cod, halibut, redfish, etc.; plankton and benthal ecology.

Summaries of research reports according to subareas are presented by the Executive Secretary (p. 79–81).

Pt. 4 contains the selected papers from the 1958 annual meeting, that of J. R. Clark and others is abstracted in this Bibliography, under his name, q.v.

Holt, S. J. Collaboration between FAO and ICNAF, 1957–58 (p. 82).

Holt, S. J. A note on the simple assessment of a proposal for mesh regulation (p. 82–83).

CLARK, JOHN R., *and others.* Summary of gear selection information for the Commission area (p. 83–99).

Clark, John R., *and* F. D. McCracken. Observations on the cod trawl fishery in the Gulf of St. Lawrence during the spring of 1958 (p. 99–100).

Clark, John R. Underwater television observations on the effect of chafing gear on escapement of haddock (p. 101–102).

Couture, Lawrence H. ICNAF mesh regulation; operation of 10% annual exemption (p. 103–104).

51936. INTERNATIONAL COMMISSION FOR THE NORTHWEST ATLANTIC FISHERIES. Statistical bulletin, v. 5, for the year 1955. Halifax, N.S., 1957. 52 p. illus., tables, map. Prepared by Ronald S. Keir.

Contains data on fisheries activities in the Convention area. Pt. 1 offers summaries of fisheries for the years 1952–55. Pt. 2 (p. 13–52) includes fisheries statistics for 1955 for the member nations (except Italy) and for Germany. The presentation in this part has been revised by placing greater emphasis on area and month of fishing activities.

Copy seen: CaMAI.

51937. INTERNATIONAL COMMISSION FOR THE NORTHWEST ATLANTIC FISHERIES. Statistical bulletin. v. 6, for the year 1956. Halifax, N.S., the Commission, Forrest Building, 1958. 58 p. illus., tables, map. Prepared by Ronald S. Keir.

Contains an introduction with list of contributors, map, etc. and, in pt. 1 (p. 7–14), a summary of fishing activities in the Convention area (approx. 40°–70° N. 40°–80° W.) for 1952–1956; number of boats active during 1956 and a list of species considered in this report. Pt. 2 gives statistics for 1956, of landings of the participant countries (except Italy); landings by species, area and gear; etc. Corrections to the previous volume are appended. ***Copy seen:*** DLC.

51938. INTERNATIONAL CONGRESS OF ZOOLOGY. 14th, *Copenhagen,* Aug. 5–12, 1953. Proceedings, Danish Science Press, Ltd. Copenhagen, 1956. 567 p. 2 plates, text maps, graphs, tables.

Contains lists of delegates, members, history of the Congress, and summaries of papers presented. Section meetings dealt with nomenclature, paleozoology, zoogeography, evolution and genetics of populations, cytology, morphogenesis, animal psychology and ethnology, comparative physiology, serology and paper chromatography, parasitology, nematology, terrestrial ecology, hydrobiology, terrestrial arthropods, etc., invertebrates, and vertebrates. The summaries, in general are extensive. Those on the North are listed in this Bibliography under the authors' names, q.v.

PAVLOVSKIĬ, E. N. Some considerations on the mammoth's ecological conditions.

SVETOVIDOV, A. N. The Atlantic origin of some groups of fishes.

HALL, E. R. Arctic to Tropics in America.

INTERNATIONAL COUNCIL FOR THE EXPLORATION OF THE SEA, *see* Plankton Symposium, 1957. Contributions: Measurements of primary production . . . sea. *1958.* No. 54021.

51939. INTERNATIONAL GEOGRAPHICAL CONGRESS. 17th, Washington, D.C., Aug. 8–15, 1952. Proceed-

ings. Washington, D.C., 1957. 776 p., illus., maps, diagrs., tables. (International Geographical Union—National Research Council.) Refs.

Contains lists of officers and committees, minutes, etc.; texts or abstracts of papers presented, and index of authors. Several of the papers dealt with the far North, viz.:

O'Dell, A. C. The hinterland areas of Scottish and Scandinavian ports in relation to industrial development (p. 161–64). *Includes* discussion of railway mileage in comparison with population and area, for Scotland, Norway, Sweden, and Denmark, and mentions the Narvik-Luleå line; like most routes in northern Scandinavia, it follows valleys.

Ahlmann, H. W. Summary of reports from the Nordic countries, Commission on periglacial morphology (p. 207–208). *Notes* absence of distinctly periglacial features from Pleistocene glaciations except fossil sand dunes; occurrence of permafrost in isolated places; attention is paid to palses or peat formations.

Drummond, R. N., *and others.* Investigations in the boreal forest of Labrador-Ungava, 1948–1951 (p. 248–54). No. 44662.

Ray, L. L. Perennially frozen ground, an environmental factor in Alaska (p. 260–64). No. 47536.

Griffiths, T. M. Glacial geomorphology on the Mt. McKinley massif, Alaska (p. 331–36). No. 45296.

Lougee, R. J. A profile of post-glacial crustal upwarp in eastern North America (p. 357, title only). No. 52921.

Meen, V. B. The origin of Chubb Crater (p. 357–63). No. 36170.

Noyes, J. R. Transportation in Alaska (p. 713). No. 36510.

Lloyd, T. The Norwegian-Soviet boundary in Lapland (p. 533–38). No. 35936.

Zaborski, B. Geographical aspests of migrations of ethnic groups in northern Eurasia (p. 555–59). No. 49029.

Robinson, J. L. The northern extension of the pioneer fringe of agriculture on the Great Plains of Canada (p. 657–62). *Notes* extension of pioneer agriculture into the southern Mackenzie River valley, and the record of successful crops in the Yukon valley near Dawson and Whitehorse.

Enequist, G. The habitation of Sweden (p. 737–41). *Notes* sparse population of northern Sweden, interrupted by the industrial centers of Kiruna and Gällivare-Malmberget. ***Copy seen:*** DGS.

51940. INTERNATIONAL GEOGRAPHICAL UNION. Nineteenth congress, Norden, 1960; first circular, Jan. 1958: symposia and excursions. (*Its:* Newsletter, 1958. v. 9, no. 1, p. 11–20, text maps.) Text in English and French.

Lists subjects and locations of symposia, including: nature and economy of northern Norway, Tromsø; the high mountain region, Abisko; and excursions, including: physical geography, especially glaciology, Tromsø-Spitsbergen-Tromsø; glacial morphology, Boden-Norrbotten-Abisko; glaciology, Kiruna-Kebnekajse-Kiruna-Abisko; and Abisko-Kårsajökel-Abisko; physical and cultural geography of Finnish Lapland, Tornio-Kilpisjärvi-Tornio; Ofoten-Vesterålen-Lofoten-Helgeland-Trondheim. *Maps* show location of symposia and excursion routes.

51942. INTERNATIONAL GEOLOGICAL CONGRESS. 21st. "Norden," Aug. 1960. First circular. Copenhagen. The organizing committee, Mineralogisk Museum, June 1, 1958. 15 p., 2 text maps.

Meetings are to be held in Copenhagen Aug. 15–25, 1960, with field excursions in West Greenland: 14 days, Julianehåb and Ivigtut; northern Norway: 16 days, Trondheim to Kirkenes and return; Spitsbergen: 16 days; Kiruna-Torneträsk area: 7 days; Skellefte district, Kiruna-Gällivare-Pajala district: 10 days; northern Sweden: 10 days; eastern and northern Finland: 10 days. Revised version pub. in its second circular, Apr. 1, 1959. p. 6–21. ***Copy seen:*** DGS.

51943. INTERNATIONAL GEOPHYSICAL YEAR, 1957–1958. U.S. NATIONAL COMMITTEE. United States buildings for Antarctica. (Polar record, Jan. 1957. v. 8, no. 55, p. 333–37, diagr.)

The buildings are adapted from those at Dundas (i.e. Thule) air base and other arctic stations. The standard buildings are 20 ft. wide and 48 ft. long and are constructed of prefabricated modular panels 4 ft. wide, 8 ft. high and 4 in. thick. Snow sills are used in the foundations erected on permanent snow. Ventilation is provided by a blower fan at both ends of each building. Diesel oil driven "Jet-Heet" furnaces are used to heat buildings in which partitions interrupt an easy flow of heat. Special structures include a latrine-darkroom-laundry building constructed of 12 ft. wall panels to allow for overhead water-storage tanks; a balloon inflation shelter housing hydrogen-generating equipment; telescoping rawin and aurora towers; geomagnetic absolute and variation buildings; Quonset huts for workshops and storage. The buildings are connected by a series of tunnels constructed of wire poultry netting and burlap laid over a framework of timber. ***Copy seen:*** DLC.

51944. INTERNATIONAL PACIFIC HALIBUT COMMISSION. Regulation and investigation of the Pacific halibut fishery in 1956. Seattle, Washington, 1957. 27 p. illus., tables, maps. (*Its:* Report, no.25.)

Includes an historical outline of United States-Canadian cooperation in this field; activities of the Commission; 1956 regulations; statistics of landings; catches per unit fishing effort; open seasons; composition of catches; growth studies; tagging experiments and migration; sub-commercial size fishes, etc. An appendix (by W. H. Hardman and G. M. Southward) covers small halibut investigations of Sept. 1955, including distribution and composition of catches, food, etc.
Copy seen: DI.

51945. INTERNATIONAL SCIENTIFIC RADIO UNION. Information bulletin no. 101, Jan.–Feb. 1957. 100 p.

Includes (p. 40–43) data on the radio observation stations at Frobisher Bay (63°28′ N. 67°23′ W.), Godhavn (69°15′ N. 53°30′ W.), and Knob Lake (54°48′ N. 66°49′ W.): geomagnetic coordinates, characteristics measured, type of apparatus, frequencies and bandwidths, other stations of the network, operating schedule, publication of results, responsible authority, and date of report.
Copy seen: DLC.

51946. INTERNATIONAL SCIENTIFIC RADIO UNION. Information bulletin no. 103, May–June 1957. 33 p.

Includes (p. 14, 16) data on the radio observation stations at Thule, 76°33′ N. 68°50′ W., and Unalaska, 53°53′ N. 166°32′ W., stating geomagnetic coordinates, characteristics measured, type of apparatus, frequencies and bandwidths, other stations in the network, operating schedule, publication of results, and date of report. ***Copy seen:*** DLC.

51947. INTERNATIONAL UNION OF GEODESY AND GEOPHYSICS. ASSOCIATION OF METEOROLOGY AND ATMOSPHERIC PHYSICS. Eleventh general assembly, Toronto, Sept. 1957. Report of proceedings, *pub.* London, 1958. p. 115–21, table, diagr. publication IAMAP no. 11/b, Symposium on polar meteorology.) Refs.

Contains opening remarks of chairman J. van Mieghem reviewing aims of the IGY meteorological program, basic differences between the two polar regions, and types (eight) of stations, and abstracts of the seven papers presented, five dealing with the Arctic, viz:

LAMB, H. H. Differences between the meteorology of the northern and southern polar regions. No. 52633.

NAMIAS, J. Synoptic and climatolog-

ical problems associated with the general circulation of the Arctic. No. 53490.

Reed, R. J., *and* W. J. Campbell. The arctic jet stream. *Describes* mean cross section through the arctic jet stream, at 500 mb. and about 70° N., based on two years' daily geostrophic wind profile data along 80° W. and 20° E.

Godson, W. L., *and* R. Lee. High level fields of wind and temperature over the Canadian Arctic. *Presents* results of study: of the time-smoothed field of temperature at 100 mb., of the winter arctic stratospheric jet stream, and of the vertical- and time-structure of the major warming epoch during the three winters considered, 1954–55 to 1956–57.

Girs, A. A. Variations over periods of years in the atmospheric circulation and changes of meteorological and ice conditions in the Arctic (9 refs.) *Discusses* relation between long-range cyclic changes in solar activity and "epochs" of 9–10 yrs. duration in atmospheric circulation, in other meteorological phenomena and in the hydrosphere. Possibility of determining causes of long-range climatic variations in the Arctic is stressed.

Discusses the problems of the Russian Orthodox church, faced with the spread of Protestantism, appeals to young Orthodox men and women to become missionaries to the Tlingit Indians, to fight Protestant propaganda. An historical outline of Orthodoxy in Alaska and a sketch of the life and ethnological work of Fr. Veniaminov, are included. ***Copy seen:*** DLC.

51957. IRVINE, D. G., *and others.* Effects of dietary phospholipid and cholesterol on the temperature resistance of goldfish. (Canadian journal of zoology, Dec. 1957. v. 35, no. 6, p. 691–709, illus., tables.) 16 refs. *Other authors:* K. Newman *and* W. S. Hoar.

Account of experiments, including exposure to 1–2° C. In the latter case the cholesterol effect was most marked during early chilling. Resistance was closely correlated with increased tissue cholesterol and weakly correlated with the less modified tissue phospholipid. The relative effectiveness of the treatments varied with the season and with the duration of feeding. ***Copy seen:*** DSI.

51958. IRVING, LAURENCE, 1895– , *and* J. S. HART. The metabolism and insulation of seals as bare-skinned mammals in cold water. (Canadian journal of zoology, 1957. v. 35, p. 497–511, illus., tables.) 20 refs.

A study of metabolic rate in five harbor seals (*Phoca vitulina*) and two harp seals (*Phoca groenlandica*) over a temperature range of 25° to −10° C. in air and 20° to 0° in water. Body surface temperatures, critical temperatures and temperature gradients were also determined. Tissue temperatures and gradients reflected the metabolic response to cold. Metabolic economy in ice water was maintained by cooling the body surface to about 1° C.; this cooling provided protection comparable to that of fur of large mammals in coldest climate.

51959. IRVING, LAURENCE, 1895– . Naming of birds as part of the intellectual culture of Indians at Old Crow, Yukon Territory. (Arctic, 1958. v. 11, no. 2, p. 117–22, table.) 2 refs.

Lists common, scientific and local native names for 103 species of birds found in this area. Recognition and naming of birds was done with great accuracy and completeness by the Kutchin Indian informant, suggesting the ability to be result of an anciently perfected system of intellectual culture. Comparison with North Alaskan Eskimo bird names disclosed only two of 91 species with the same name, indicating the paucity of intellectual culture exchanges in contrast to the more liberal material culture exchanges of these neighboring peoples.

51960. IRVING, LAURENCE, 1895– , *and others.* On the melting points of animal fats in cold climates. (Physiological zoology, Apr. 1957. v. 30, no. 2, p. 93–105, illus., table.) 20 refs. *Other authors:* K. Schmidt-Nielsen *and* N.S.B. Abrahamsen.

Account of investigation of melting points of bone marrow fat and tissue fat from legs of six arctic species and some herbivores from temperate and tropical zones. It was found that fats of low melting point are selectively deposited in the distal parts of the extremities. This condition, apparently useful in cold weather, is not considered an adaptation to cold climate, witness its presence in the tropical and temperate forms.

51961. IRVING, LAURENCE, 1895– . On the naming of birds by Eskimos. (Alaska. University. Anthropological papers, May 1958. v. 6, no. 2, p. 61–77, tables.) 17 refs.

Discusses and tabulates (with English equivalents) the names given to local bird species by Eskimos living in Anaktuvuk Pass and along the Kobuk River, Northern Alaska. Though few birds are hunted by these Eskimos, bird study is highly developed and is considered a cultural and intellectual distinction; this may account for the large number of species named: 90 of a possible 107 by Nunamiut (Anaktuvuk), and 103 of

122 by Kobuk Eskimos, altogether 84% of the local birds. These names are compared with those used along the coast east of Colville River, on Southampton Island and in Greenland. The names used in these widely dispersed communities have a high degree of similarity.

51969. ISHIDA, TAMOTSU. Acoustic impedance of snow layer. (Teion kagaku, 1956. ser. A, v. 15, p. 81–91, illus.) 4 refs. Text in Japanese. Summary in English.

Results of measurements according to Barnek's curve-width method of the specific normal acoustic impedances of snow layers with rigid-wall backing are reported. Resistance and reactance of the impedance and sound-absorption coefficients of snow samples were calculated for various sound frequencies and sample thicknesses. The acoustic model of new snow was found similar to a system with cavities and capillary tubes. Impedance characteristics of various thicknesses of new snow agreed with the input impedance of the electric C–R recurrent network terminated at its far end by an infinite impedance, which was analogous to the acoustic model.—From SIPRE. ***Copy seen:*** DWB.

51970. ISHIDA, TAMOTSU, *and* **H. SHIMIZU.** Determination of the resistance to air flow of snow layer, 2; portable σ-meter. (Teion kagaku, 1956. ser. A, v. 15, p. 63–71, illus.) 4 refs. Text in Japanese. Summary in English.

A portable mechanical analogue to the Wheatstone bridge for measuring the resistance of snow to air flow is described. The instrument consists essentially of narrow glass tubes (for consistent resistances), a variable leak-cock (for variable resistance), an inclined-tube alcohol manometer (instead of a galvanometer), and a rubber hand-bellows as a pressure source. The meter was found satisfactory in tests; it can be operated with ease by one person. ***Copy seen:*** DWB.

51971. ISHIHARA, YOSHIO, *and others.* Structure of sperm- and sei-whale insulins and their breakdown by whale pepsin. (Nature, *London,* May 24, 1958. v. 181, no. 4621, p. 1468–69, illus.) 7 refs. *Other authors:* T. Saito, Y. Ito, *and* M. Fujino.

Chemical analyses reported indicate that sei-whale insulin differs from sperm insulin "in that an *iso*leucine residue is replaced by an alanine and the three residues in positions 8–10 of the A chain are Ala. Ser. Thr." Whale pepsin was found to have a somewhat different specificity than swine pepsin. ***Copy seen:*** DLC.

Presents map and outlines geologic structure of this region (66°50′N. 37°50′E.). Stratigraphic cross-section is evaluated and characterization is given of adjacent country rocks: biotite gneiss, amphibole-biotite gneiss, amphibolite, actinolite shale, oligoclase gneiss-granite and others. Through contact with adjacent rocks, the alkaline granites occurring here are gneissose-granites, which are treated in detail. Their form and zonal structure are described; texture features and cleavage outlined; microstructure and optical constants examined. Petrographic characteristics, component minerals, chemical composition and other features are outlined. ***Copy seen:*** DLC

51996. IVANOV, A. M. Shchelochnye granity Zapadnykh Keĭv. (*In:* Akademiîa nauk SSSR. Kol'skiĭ filial. Shchelochnye granity Kol'skogo poluostrova, 1958. p. 19–65, illus., tables, diagrs., maps, incl. 1 fold.) Text in Russian. ***Title tr.:*** Alkaline granites of Zapadnyye Keyvy.

Presents a comprehensive outline of the geologic structure and a petrographic and petrologic description of the Zapadnyye Keyvy (approx. 67°30′–68° N. 35°25′–37°15′ E.), based on the author's and others' work. The large intrusion of alkaline granites, extending over an area of 3,000 km.^{2}, is treated in detail. The main component minerals are: aegirite, alkalic amphibole, plagioclase, microcline and quartz; accessory minerals: orthite, sphene, fluorite, zircon, astrophylite, hematite, aenigmatite, and magnetite. They are characterized and the quantitative mineralic composition is presented. Crystallization and chemical composition of these alkaline granites, are outlined. Texture features, fractures, microscopic structure are studied and illustrated by diagrams. Nature, age, and history of the intrusion are discussed. ***Copy seen:*** DLC.

52003. IVANOV, IVAN TIKHONOVICH. Usilenie osnovaniĭ, fundamentov i sten zhilykh zdaniĭ. Moskva, Izd-vo Ministerstva kommunal'nogo khozi͡aĭstva RSFSR, 1955. 160 p. illus., 48 tables, diagrs., map. 14 refs. Text in Russian. ***Title tr.:*** Reinforcement of ground bases, foundations and walls of residential buildings.

Causes of deformation of old and new buildings are analyzed and methods of repair are described. The causes are classified as natural (age, poor drainage, appearance of ground water, excessive freezing, effect of nearby construction, etc.), and those due to errors in design or in building methods. Foundation deformation and ground sagging or heaving, with and without excavation, are studied. Loads and stresses are computed and analyzed in relation to the geographic location (map p. 38) and climatic conditions. Method of foundation reinforcement is selected according to local conditions. Building foundations are partially or totally replaced by sections; they may be reinforced by the injection of liquid cement or sodium silicate into the disintegrating masonry,

or among loose stone of the foundation, or into the ground itself, beneath or alongside. In the case of ground water appearing, or of defective drainage (sewer or other water), new drain walls and channels are built. The standards for allowable stresses, properties of materials and specifications for other parts of the construction are given in tables which include frost-resistance data for stones, gravel, bricks, siliceous and magnesia cements, etc.

52021. IVES, JOHN DAVID. Geomorphological investigations in the Torngat Mountains of northeastern Labrador-Ungava. (Arctic, 1957. v. 19, no. 4, p. 243–44.)

Reports summer 1957 field work, continuing that reported in No. 52022. Features representing late-Pleistocene limits of trunk glaciers flowing eastward from a continental ice cap were studied. A chronology of the final emergence from the last ice sheet, and of ice-dammed lakes was constructed. Conclusions: the Torngat Mts. were influenced during late-Pleistocene times by two distinct glaciations, separated by an interglacial period of considerable intensity. The final glaciation is tentatively correlated with the Wisconsin of central North America; the earlier one is uncertain, possibly equivalent to the Illinoian, or of post-Sangamon age. ***Copy seen:*** CaMAI.

52022. IVES, JOHN DAVID. Glaciation of the Torngat Mountains, northern Labrador. (Arctic, 1957. v. 10, no. 2, p. 67–87, map, illus.) 22 refs.

Considers role of these mountains in glaciation of Labrador-Ungava, assessing particularly events in late-Wisconsin times with respect to final disappearance of both continental and local ice masses. Conflicting theories are discussed, and evidence presented, based on physiography and findings from summer 1956 field work, including unmistakable erratics on summits at 4,000–5,000 ft. The highest summits were completely submerged by eastward moving continental ice during the Wisconsin glaciation; local glaciers never reached significant dimensions; rapid melting *in situ* of thick masses of ice occurred during the final Wisconsin stages. Two or three separate glacial periods are recognized from the morphology of the area. Instantaneous glaciation of a large area of the Labrador-Ungava Plateau probably initiated a continental ice sheet in northeastern North America at the onset of each glacial period. *Also pub.* in International Union of Geodesy and Geophysics, Association of Scientific Hydrology, 11th assembly report of proceedings 1958, v. 4, p. 372–86.

52023. IVES, JOHN DAVID. Mountain-top detritus and the extent of the last glaciation in northeastern Labrador-Ungava. (Canadian geographer, 1958. no. 12, p. 25–31, illus.) 16 refs.

Presence of mature mountain-top detritus ("a specific type of boulder field formed by disintegration of bedrock *in situ* by frost-shattering") may indicate the persistence of ice-free areas (nunataks) during the last glaciation. If the time required for its mature development was longer than the post-glacial period, the areas where it is found were not covered by the ice. Evidence from studies in 1956–1957, described in some detail, indicates that the detritus was initiated before the last glaciation. High-level erratics found in the Torngat Mts. appear to have been deposited by an earlier glaciation. Application of this concept to other parts of Labrador and northern Canada is considered; it

may be of use in evaluating extent and thickness of the last ice sheets.

The insufficiencies of this type of net especially in long, deep hauls, are analyzed and an improved version described which sinks quickly thus shortening operation time; it also is less prone to drifting than the original type.

52029. IZVEKOV, M. V. Iz zapisok gidrologa. (*In:* Burkhanov, V. F. Cherez okean na dreĭfuiushchikh l'dakh, 1957. p. 247–82, illus.) Text in Russian. ***Title tr.:*** From a hydrologist's notebook.

Drifting station North Pole-4, its life and work in 1954–1955 are sketched by the hydrologist of its first team: the flight from Tiksi Bay to the camp, personnel, the tent used: KAPSh-1 (kruglaia arkticheskaia palatka Shaposhnikova, Shaposhnikov's round arctic tent, type 1). The oceanographic work is noted, including ice-drilling, IU. K. Alekseev's automatic current meter (p. 257–58); also the aerological and magnetic observations. Health conditions, visits of wildlife, etc., recreation, are described. A helicopter trip was made to the camp of North Pole-2, abandoned in 1951; and the return flight back to the mainland Apr. 17, 1955. ***Copy seen:*** DLC.

Two old glaciations in this region (64°10′ N. 145°50′ W.) are distinguished; relative position, orientation, and appearance of moraines, differences in sedimentation of kettle lakes, young and old glaciated surfaces, are dealt with; stream dissection, age of outwash deposits, and stream terraces are also considered. Present vegetation, glaciers, frost action, drainage patterns, landforms, and aggradation on the north slope of the high Alaska Range are discussed. Discussion is elucidated by 34 air photographs.

52034. JACKSON, HARTLEY HARRAD THOMPSON, 1881– . The return of the vanishing musk oxen. (Smithsonian Institution. Annual report 1957, *pub.* 1958. p. 381–89, illus.) Reprinted from Audubon magazine, Nov.–Dec. 1956, Jan.–Feb. 1957.

Presents information on past and present number of musk oxen (high estimate now: 20,000, mostly on arctic islands); its physical appearance and name; food; disposition and behavior; development and growth; enemies and defense against them. The transfer in 1930 of 34 musk oxen from Greenland to Alaska and the six-year study carried out at the Alaska Experimental Station by C. H. Rouse and L. J. Palmer, are described in detail. The experiment discouraged domestication or commercial use, but demonstrated successful adaptation. The musk oxen, transferred from the Station to Nunivak Island in 1936, maintain their rate of increase as in Greenland. ***Copy seen:*** DLC.

52035. JACKSON, WILLIAM D. Impact of global concepts of military planning. (*In:* U.S. Quartermaster Food and Container Institute for the Armed Forces, Chicago. Low temperature test methods and standards for containers, 1954. p. 1–3.)

Introductory statement in symposium: the problems involved in developing containers for use in the Arctic are complex, and require research on technical aspects of packaging and preservation of supplies. Strategy requires that the Army be equipped for full-scale operations above the Arctic Circle. ***Copy seen:*** DLC.

52036. JACOBI, HANS. Nogle betragtninger over Jakobshavnsfiskernes økonomiske og erhvervsmaessige vilkår. (Grønland, Oct. 1958, nr. 10, p. 368–76, illus., maps.) Text in Danish. ***Title tr.:*** Some reflections on the economic and occupational conditions of the Jakobshavn fishermen.

Compares the earning possibilities of fishermen and hired workers at this West Greenland town, to the disadvantage of

the former. Considering the hazards and hardships of the work, outlay for gear, transport, etc., the fishermen's income is too low. An undesirable imbalance between the two categories of workers can result. ***Copy seen:*** DLC.

52056. JELLINEK, H. H. G. Adhesive properties of ice. Wilmette, Ill., Sept. 1957. iv, 20 p. illus., tables, graphs. (U.S. Army. Corps of Engineers. Snow Ice and Permafrost Research Establishment, Research report 38.) 24 refs.

"Shear tests of the system snow-ice/stainless steel gave pure adhesive breaks down to a temperature of about —13° C., where a sharp transition to cohesive breaks was observed. Adhesive strength of the system was a linear function of temperature and independent of cross-sectional area and height of samples in the ranges tested. Shear tests of the system ice/polystyrene gave pure adhesive breaks, with adhesive strength decreasing linearly with temperature to —15° C. and independent of cross-sectional area. Tensile tests of the system ice/polystyrene revealed a linear relation between adhesive strength and temperature in the range —2° C. to —25.5° C. regardless of cross-sectional area and rate of stress application. The test results are interpreted on the basis of an assumed liquidlike layer at the interface."—Author's abstract.

52066. JENSEN, HENRY. On the beat-distribution in group-microseisms. København 1957. 27 p. illus., tables, diagrs. (Denmark. Geodaetisk Institut. Meddelelse no. 34.) 23 refs. Summary in French and German.

The annual variation for microseismic amplitude and period in Scoresbysund (East Greenland) and Copenhagen is given. It is shown that the beat-interval is logarithmic-normally distributed with only one parameter, for which the simple mean may be chosen. The mean value of the beat-interval is proportional to the period in the carrier-wave. The beat-interval is greater in the vertical records than in the horizontal. This may be explained by assuming a Love-component in the microseisms. ***Copy seen:*** DLC.

52067. JENSEN, L. A. Spaendende og nervepirrende tid for den grønlandske fåreholder; fåreholdernes vinterfodringsproblemer. (Atuagagdliutit: Grønlandsposten, Feb. 27, 1958. Ukiut 98-iat, nr. 4, p. 8–9, 24.) Text in Danish. ***Title tr.:*** Exciting and nerve-racking times for the Greenland sheep farmer; the winter feeding problems of the sheep farmers.

Outlines the present situation and plans for the future. Ideally 400 hectares of cultivated land are required to winter feed the present stock of some 20,000 sheep. A hundred hectares is the present objective to be supplemented by fodder re-

serves from good years, and other feeding stuffs, such as seaweed, fish and fish offal. Intensified cultivation projects are being carried out by the agricultural stations.

ecology and geographic distribution of 27 birds, some of the species extending north of the Arctic Circle. Previous parts of this basic work are listed as No. 45803, and *supra*. ***Copy seen:*** DSI.

52088. JOHANSEN, HARALD. On the relation between meteorological conditions and total amount of ozone over Tromsö. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 1, *pub.* 1958, p. 187–94, diagrs.)

Variations during the period May 1941–Oct. 1941 were studied at the Aurora Observatory, Tromsø. The correlations between total ozone and various meteorological elements such as tropopause height, upper-air temperature, and potential temperature are tabulated. The results indicate that dynamical processes are of great importance to the connection between ozone and weather. "Variation of five-day means of ozone studied in relation to five-day means of pressure and temperature at 6 km. disclosed that the ozone content varies inversely to the upper cold troughs and warm ridges."

52095. JOHNSON, HARRY McCLURE. Winter microclimates of importance to Alaskan small mammals and birds. Mar. 1957. 145 p. illus., table (U.S. Air Force. Arctic Aeromedical Laboratory. Technical report 57–2.) 50 refs.

A study of macro- and microclimatic conditions and zones and their utilization during the winter by a series of small mammals and birds of the Interior and the Arctic Slope and Coast. In general, the animals avoided the severe conditions of the coldest zones (the snow surface) by retreating to warmer, usually the subnivean, zones. Temperatures in the warmest subnivean zones were usually 20° to 25° F. even during cold snaps, and 25° to 30° during warmer periods. Temperature gradients across a snow cover of two feet were as high as 90° to 100° F. When occasionally the birds fed on the cold (−60° to −70° F.) snow surface they showed adaptive behavior.

Two females (mother and calf) found on Gossen Island (approx. 62°40′ N. 06°50′ E.) in Romsdal, Apr. 1957, are described in detail, with measurements. Previously known strandings of the species are reviewed. The following conclusions are drawn from the examination of the animals: mating and birth in this whale take place in late winter or spring; the gestation period is about one year; at birth the calf is six to seven feet long; it sucks for about one year and at weaning is probably about ten feet long.

52103. JONSGÅRD, ÅGE. Taxation of fin whales, *Balaenoptera physalus* (L), at land stations on the Norwegian west coast. (Norsk hvalfangst-tidende, Sept.

1958. årg. 47, nr. 9, p. 433–39, tables, diagrs.) Text in Norwegian and English.

Survey based mainly on figures from Steinshamn (approx. 62°45′ N. 06°30′ E.) the only whaling station operating continuously during 1946–1957. The total catch (392 in 1946, 92 in 1957) and number of whales taken by each vessel declined during the period. Average length and percentage of mature whales seem also to have diminished. The fin whales off Norway and round the Faroes belong to the same stock, so figures are given for the latter area as well and these too show a falling tendency. The taxation of fin whales in these areas together should be limited to about 300 animals per season, to prevent further reduction of the stocks. ***Copy seen:*** SPRI.

Annual survey (cf. No. 45831) in Nome, Fairbanks, Seward, Anchorage, Juneau, Sitka, and Ketchikan. Average prices in Aug.-Sept. are listed for approx. 200 items grouped as: food, housing, clothing, transportation, medical and personal care, recreation, other goods and services. Comparisons are made with 1956 prices (base period) and between the Alaskan and Seattle prices. Though lower for certain items, 1957 and 1958 prices generally were higher; also Alaskan cities' prices generally were higher than Seattle.

52110. *JOURNAL OF GLACIOLOGY.* Instruments and methods: ice drills and corers. (Journal of glaciology, Mar. 1957. v. 3, no. 21, p. 30, 2 illus., diagr.)

A drill designed by the Snow, Ice and Permafrost Research Establishment is depicted; one in. (25.4 mm.) diam., it cuts wet or dry glacier ice at 0.5mm./min. A coring auger, also shown, for shallow or deep drilling in névé and ice, cuts a core of three in. (7.62 cm.) diam., 0.5 m. length; it has been used with up to 31 one-meter extension rods. ***Copy seen:*** DGS.

52111. JOURNAUX, ANDRÉ, *and* **F. TAILLEFER.** Les mines de fer de Schefferville. (Cahiers de géographie de Québec, Oct. 1957. année 2, no. 3, p. 37–61, 3 illus., 4 text maps, 2 tables.) 11 refs. Text in French. Summary in English. ***Title tr.:*** The iron mines of Schefferville.

Physical geography of the Knob Lake region, 360 mi. north of the St. Lawrence is described; abundant reserves and high quality of ore make extraction profitable. Geology of the deposits, ore extraction (open pit method) and transport are dealt with. Operations are suspended from late-Nov. to mid-Apr. Ore production 12 million tons in 1956, is to reach 20 million in a few yrs. Schefferville has a population of 1,630, and some 1,870 "seasonal" inhabitants and Indians. Selected census data given include wages, living cost, housing. Indian inhabitants, town life and administration, etc., are discussed. ***Copy seen:*** DLC.

52112. JOURNAUX, ANDRÉ, *and* **F. TAILLEFER.** Les villes minières du Labrador. (Association de Géographes Français. Bulletin, Dec. 1957. no. 269–70, p. 43–57, graphs.) Text in French. ***Title tr.:*** The mining towns of Labrador.

Analysis of human geography and settlement resulting from the Burnt Creek (54°49′ N. 66°53′ W.) and Knob Lake (54°48′ N. 66°48′ W.) mining by the Iron Ore Co. of Canada. Physical environment and mining conditions are described with personnel data. Wages, housing and living standards (including budgets) are discussed. The growth and development of the town of Schefferville is traced with consideration of its municipal organization and problems of providing community facilities. Its population which includes Indian migrants has 70% in the 20–40 age group, and 75–80% men in summer. Its social, intellectual and religious life, and enterprises other than mining are discussed. The growth of Seven Islands on the Gulf of St. Lawrence from fishing village to port for shipping ore is discussed and its age-sex ratios compared with Schefferville. ***Copy seen:*** DLC.

Describes a method of producing topographic maps of a moving glacial ice cliff surface by terrestrial photogrammetry, developed during investigations (1955?) at Nunatarssuak (76°40′ N. 67°35′ W.). A straight base line was selected at 100-150 m. distance from the cliff and nearly parallel to it. Control targets were established on the ice cliff surface and their positions with respect to the base line were determined by triangulation. Overlapping photographs were taken from several points along the base line, and techniques were developed for using the photographs to compile topographic maps with the Kelsh plotter. Changes in cliff position were determined by comparing two maps based on data obtained at different times. ***Copy seen:*** DLC.

Text in Russian. ***Title tr.:*** The results of geologic exploration for oil prospecting in the Lena-Olenek province.

Outlines the stratigraphy, lithologic characteristics and the results of geologic and geophysical exploration for oil and gas in the area 70°–73° N. 118°–128° E. More detailed investigations were made in two sections: around Tyumyati (approx. 71°55′ N. 123°50′ E.), and in the Ulakhan-Yuryakh district on the left bank of the Olenek River, near its mouth (approx. 73° N. 119°40′ E.). For both of these sections a summary is given of the core drillings and deep test wells. Rock composition porosity, permeability and other properties are reviewed. Test results of bitumen, gas and water are presented. Various factors indicating good possibilities for oil and gas are discussed; further, more complex investigations are urged. ***Copy seen:*** DGS.

52123. KACHADOORIAN, REUBEN, 1921– . Engineering geology of a segment of the Denali Highway. (*In:* Alaskan Science Conference . . . 1954. Proceedings *pub.* 1957. p. 52–55.)

Results of geologic examination of parts of the Healy A–1, Healy A–2, and Mt. Hayes A–6 quadrangles, Alaska, made during the 1953 field season by a four-man party from the U.S. Geological Survey. Detailed mapping was carried out adjacent to the highway route, with emphasis on factors affecting construction. General geology is described; glacial deposits are noted; major construction problems will probably arise in areas of silty till. Non-glacial unconsolidated sediments are locally important in planning the highway; gravelly alluvium is the only one suitable for road foundation. ***Copy seen:*** CaMAI.

Eläintieteellisiä julkaisuja, v. 16, no. 11) 178 refs. Text in German. Summaries in English and Finnish. ***Title tr.:*** Recent spread of the lapwing, *Vanellus vanellus* (L.), in Finland.

The lapwing, which breeds in meadows and on cultivated land up to the 66° N. and occurs occasionally in the Enontekio region of Finnish Lapland and the Petsamo region, has spread rapidly since 1890. The spread is evidently connected with recent changes in climate and with certain factors influencing the reproductive rate, mortality, and dispersion of this bird. The rising spring temperature in Finland is conducive to increase of its population: there is less mortality at the end of the migration period, immigrants and birds starting to breed have increased in number; and fewer females, having lost their first clutches, stop breeding.

Evaluates and summarizes prospects in the 2,000,000 km.^{2} area 66°–130° E. between the Arctic Circle and Kara and Laptev Seas. Sinian and Cambrian, Devonian, Permian, and Mesozoic deposits are analyzed in respect to oil and gas prospects; and zones (distinguished as: possible, probable, clarification required, without prospects, supposed, established, with bitumen in rocks, liquid fuel in depth, gas in the bore holes, etc.) are mapped. Zones of established prospects are the Anabar-Khatanga interfluve, Olenek district, and Ust'-Yenisey district; the Taymyr depression and Siberian platform are considered probable zones, the Tungusska syncline requires clarification. Various types of investigations are outlined and data are given. Nowhere has oil or gas been found as yet in commercial quantity, but this is

attributed to insufficient exploration, methods not quite adequate, and to lack of deep boring. ***Copy seen:*** DGS.

52136. KALINKO, M. K. Rezul'taty poiskov i razvedki nefti i gaza v raĭone Anabaro-Khatangskogo mezhdurech'îa, Nordvikskiĭ raĭon. (*In:* Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Trudy, t. 92, Nefte-gazonosnost' severa Sibiri, 1958. p. 134–70, tables, fold. cross-section, text map.) 10 refs. Text in Russian. ***Title tr.:*** The results of prospecting and exploration for oil and gas in the region of the Anabar-Khatanga interfluve, Nordvik district.

Presents a comprehensive account of prospecting in this 50,000 km.² area between the Khatanga and Anabar Rivers from 72° N. north to the Laptev Sea. An oil outcrop was first known here in 1804, possible production was indicated in 1926, and prospecting work has been carried on during the 1934–1953 period. Beside geologic, gravity and seismic surveys, 381 core drillings, and 38 deep test wells have been made. Stratigraphy and tectonics of the area are reviewed. Oil and gas prospecting is reported for seven different structures in turn, with tabular summary of the results. Physical and chemical properties of oil, gas and ground water are described. Five oil-bearing localities (Nordvik, Yuzhno Tigyan West, Yuzhno Tigyan East, Il'insk, and Kozhevnikov) are considered promising, despite the fact that the present oil output is insignificant. ***Copy seen:*** DGS.

Reviews V. V. Belousov, N. S. Shatskiĭ, and others' tectonic divisions of this region (approx. 71°–75° N. 103°–128° E.) and presents his own: eight zones instead of the five hitherto distinguished. Each zone, its boundaries, main features and subdivision, is summarized and shown on map. The new division corresponds with that in N. S. Shatskiĭ's tectonic map of the U.S.S.R. 1952, but is more detailed to meet requirements of this region. ***Copy seen:*** DLC.

Account of temperature record from the abdominal cavity of a 34-foot whale killed instantly. There was a continuous temperature rise in the dead body, apparently due to bacterial activity, until the belly was cut open to let in sea water. ***Copy seen:*** DA.

52169. KAPITONOV, IL'ÎA TROFIMOVICH. Trelevka lesa traktorami S–100L. (Mekhanizat͡siîa trudoemkikh i tîa͡zhelykh rabot, Jan. 1958. god 12, no. 1, p. 31–33, illus., table, plan.) Text in Russian. ***Title tr.:*** Log trailing with the S–100L tractor.

A modernized and improved tractor (S–80) is used the year round in the forests of the Northern Ural. Maximum engine power is 100 hp., pull is 1,050 kg. in fifth gear and 9,000 kg. in first. Driving speed varies from 2 to 10 km./hr. Tractor components are suitable for

winter work at temperatures down to −42° C. and in snow 120 cm. high. The driver's compartment is heated. Construction and maintenance of the caterpillar links and gears are described in detail, including arrangements for removing snow and mud. Log-trailing operations are outlined for various weather and terrain conditions. Data of operations and productive output in winter, summer and spring are tabulated for the S–80 and S–100L tractors.

Directorate of Scientific Information, T–293–R. 3 p. (copy at DGS). ***Title tr.:*** Retreat of the Novaya Zemlya glaciers.

The present period is characterized by retreat of glaciers generally in the Arctic. Observations of 1955 compared with a 1933 map and other data disclose an intensive retreat on the northwest coast of Novaya Zemlya, mainly by calving at the ice-front, due to the rise in temperature of the coastal waters and decrease in their salinity. Exceptions to the general shrinking are some glaciers of evident individual regime, e.g., Shokalskiy in Russkaya Gavan, stationary during 1933–1952. Study of such phenomena was undertaken on Novaya Zemlya as part of the IGY program.

52190. KARLSTROM, THOR NELS VINCENT, 1920– . Alaskan evidence in support of a post-Illinoian pre-Wisconsin glaciation. (Geological Society of America. Bulletin, Dec. 1957. v. 68, no. 12, pt. 2, p. 1906–07.) Abstract of a paper presented at the Eighth Alaskan Science Conference in Anchorage, Sept. 10–13, 1957.

Significant and roughly equal age differences between the Naptowne, Knik and Eklutna glaciations are suggested by the glacial deposits in the Cook Inlet region recording the pre-Naptowne Knik glaciation; by buried soils exposed in some parts of the area, which record major retreatal intervals both preceding and following the Knik advance; also by boulder counts, geomorphic expression of moraines, and stratigraphic evidence. The Naptowne glaciation is correlated by radiocarbon dating with the Wisconsin and Weichsel stages of the continental type Pleistocene chronologies. This evidence is presented as indication that the Knik and correlative events are of comparable rank to the Wisconsin glacial stage. ***Copy seen:*** DGS.

52191. KARLSTROM, THOR NELS VINCENT, 1920– . Tentative correlation of Alaskan glacial sequences, 1956. (Science, Jan. 11, 1957. v. 125, no. 3237, p. 73–74, illus.) 14 refs.

A revised chart, and a discussion of Alaskan glacial sequences, based on additional field observations and improved radiocarbon determinations. The latter provide a chronology which is in general agreement with similar Wisconsin-type sequences and with historical, varve and radiocarbon data of the northern European Fourth Glacial and post-Glacial. The correlations support the concept of essentially contemporaneous past climatic changes throughout the Northern Hemisphere.

52203. KAUFMAN, ALVIN. Southeastern Alaska's mineral industry. Washington, D.C., 1958. 37 p. maps, graphs, tables. (U.S. Bureau of Mines. Information circular 7844.) Approx. 45 refs.

Reports on potential mineral wealth and factors affecting its development. Lode mine production 1906–1956 is listed by years for gold, silver, platinum group metals, copper, lead and zinc. Occurrences of antimony, barite, copper, garnet, gold, gypsum, iron, lead-zinc, limestone, molybdenum, nickel, titanium, tungsten, uranium and other radioactive minerals are discussed and mapped. Labor supply, air transport (rates, lines), water supply, and hydropower are considered, also, by areas, potential waterpower. Market outlook is surveyed for

copper, lead, zinc, iron, titanium, uranium, antimony, nickel and tungsten, noting some processing companies within economic shipping distance.

52206. KAUTSKY, GUNNAR. Ein Beitrag zur Stratigraphie und dem Bau des Skelleftefeldes, Nordschweden. Stockholm, Norstedt, 1957. 65 p. illus., diagrs., map. (Sweden. Geologiska undersökningen. ser. C, Avhandlingar och uppsatser, no. 543. Årsbok 49 (1955), no. 3) 26 refs. Text in German. Summary in English. ***Title tr.:*** A contribution to the stratigraphy and geology of the Skellefte region of northern Sweden.

Physical characteristics and stratigraphic sequence of rocks in this region (approx. 64°45′ N. 21° E.) of northeast Sweden are reviewed. Local age relationships of structures of both sedimentary and volcanic origin are described in detail. In contrast with Gavelin and Kulling (No. 51100) Kautsky believes the Revsund granite to be younger than the Vargfors series because it lacks the regional schistosity common to the older rocks. Granite boulders in the Vargfors conglomerate represent older granites which locally may resemble the Revsund. Two stratigraphic columns, representing viewpoints of specialists in the area, are presented and compared.

52207. KAUTSKY, GUNNAR. Gibt es in den skandinavischen Kaledoniden Flysch? (Geologiska föreningen, *Stockholm.* Förhandlingar, 1948. bd. 70, häfte, 2 p. 279–94, 2 diagrs.) 25 refs. Text in German. Summary in English. ***Title tr.:*** Are there Flysch in the Scandinavian Caledonides?

Comparison is made between tectonic units and stratigraphy of the eastern Alps and the Caledonides of Scandinavia. Although the two mountain chains are believed to have essential differences, Flysch sediments might be expected in Caledonian areas west of the Cambro-Silurian overthrusts in Jämtland but east of the western Cambro-Silurian Köli belt. Two tectonic units in the northern Scandinavian Caledonides are referred to. Further study is required on a rock series attributed to the Seve-schists which may be analogous to the Flysch of the Alps.

52225. KEEGAN, THOMAS J. Arctic synoptic activity in winter. (Journal of meteorology, Dec. 1958. v. 15, no. 6, p. 513–21, text maps, tables.) 6 refs.

Analysis of wintertime distribution, structure and motion of cyclones and anticyclones in the Arctic, based upon 15 months' data, viz.: Dec. Jan. Feb., 1952–1957. Histories of the most important types of pressure systems are described, and interaction between arctic and middle latitudes is noted. Study discloses that the Arctic is a region of great synoptic activity, with cyclones outnumbering anticyclones about 2 to 1. Generally, cyclones are warm in the troposphere; cyclones originating in the Arctic are cold-core. Anticyclones are usually colder than cyclones. Synoptic activity in this region is very complex and is closely related to that of middle latitudes. ***Copy seen:*** DWB.

(Journal de physiologie, June-July 1958. t. 50, no. 4, p. 853–60, tables.) 13 refs. Text in French. ***Title tr.:*** Influence of experimental hypothermia upon variations in hepatic glycogenolysis of rats.

Account of experiments with male animals made hypothermic by cold immersion. Glycogenolysis became inhibited when body temperature fell from 27° to 24° C. and stopped completely between 17° and 11° C. Insulin administered in the latter case had no effect but adrenalin reduced glycogenolysis. Adrenalin production is suspended in deep hypothermia. ***Copy seen:*** DNLM.

A study based largely on an expedition sponsored by the Office of Naval Research (June 4–Aug. 19, 1952) and field trips during the summers of 1956 and 1957. The Colville and its tributaries are the main drainage system of the Arctic Slope. The area, its geology, climate and phenology are described. Local avian habitats are characterized, 11 types are recognized along the Colville; biological and ecological data are given on the birds living in each type. An annotated list follows (p. 28–76) of 87 species, with information on distribution, abundance, habitat, breeding and other behavior; also data on specimens if taken.

"Variations in permafrost depth associated with relief, vegetation cover, and soil composition are described. The effects of permafrost, severe climate, and moisture on physical and chemical soil processes, including humus formation in the active layer, are examined in detail. Data on the chemical composition, structure, and hygroscopic properties of East Siberian soils are tabulated. Average thickness of the active layer is about 1 m. in deciduous mountain taiga, 1.5–2.5 m. in deciduous lowland taiga, 2–2.8 m. on the steppes, and 3 m. or more on grass-covered river valleys and slopes. Permafrost and peat cover prevent soil moisture from evaporating. The accumulation of moisture and salts in the active layer causes swamping of large areas, resulting in ground deformations and erosion."—SIPRE.

52271. KHODAK, ÍŪ. A. Vtorichnye mineraly nizhne-kembriĭskikh otlozheniĭ Aldanskogo raĭona ĪAkutskoĭ ASSR. (Akademiĭa nauk SSSR. Geologicheskiĭ institut. Trudy, 1956. vyp. 5, p. 169–200, 7 plates, 10 tables.) 59 refs. Text in Russian. ***Title tr.:*** Secondary minerals of Lower Cambrian deposits in the Aldan River region of Yakut A.S.S.R.

Describes petrographic and chemical characteristics of secondary, or newly formed, minerals of the Lower Cambrian sedimentary rocks. Lower Cambrian deposits consist of syngenetic, diagenetic and secondary minerals. Of the last, several are described: quartz and chalcedony, feldspars, newly-formed minerals of titanium (leucoxene, brookite, rutile), carbonates (calcite, dolomite), fluorite, pyrite, marcasite, magnetite, sericite, hydromica, kaolinite, garnet, barite, sulfur, and gypsum; and for some of these, the spectral, optical and chemical properties are outlined. Formation of new minerals depends primarily on the initial composition of sedimentary rocks, also on petrographic composition of cover, chemical properties of ground waters, geologic conditions, porosity, and separation of the rocks. It is concluded that newly formed minerals occur in four ways: (1) as products of recrystallization of syngenetic and diagenetic minerals without substantial changes of their chemical composition; (2) as products of chemical transformation; (3) as products of chemical modification of brecciated and clayey materials; and (4) as products of over-enlarged and brecciated minerals. This type of investigation, author notes, is new, initiated by the All-Union conference on sedimentary rocks in 1952.

Text in Russian. ***Title tr.:*** Excerpts from the journal of the 1822 voyage of Khromchenko.

Contains the April–July 1822 section of Khromchenko's journal kept on the *Golovnin*, omitting some details on weather and changes in course. This second expedition of Khromchenko (in charge) and A. K. Étolin was to continue their 1821 survey, for the Russian-American Company, of the west Alaskan coast and islands between Cape Newenham (Bristol Bay) and Norton Sound and gain knowledge of the inhabitants of the area. Weather, navigation conditions and geographic features are noted; the customs, economy, clothing, beliefs, etc., of the natives are described. Glossaries, over 100 words each, with Russian translations, are given for five Eskimo languages: Koniag, Aglegmut, and those spoken on Nunivak, Stuart and St. Lawrence Islands. A review of the Russian-American Co.-sponsored expeditions during 1803–1821 introduces this journal. ***Copy seen:*** DLC.

52277. KHROMOV, SERGEĬ PETROVICH, 1904– . Geograficheskoe rasprostranenie mussonov. (Vsesoi͡uznoe geograficheskoe obshchestvo. Izvestiĭa, Jan.–Feb. 1957. t. 89, vyp. 1, p. 7–13, text map.) 14 refs. Text in Russian. ***Title tr.:*** The geographic distribution of monsoons.

Monsoons are considered (as by H. Flohn) not only tropical, but, in extension of Flohn's views, a planetary meteorological phenomenon which manifests itself in various forms of atmospheric circulation typical for each latitudinal belt. Four monsoon zones are distinguished: tropical, sub-tropical, temperate and polar (above 70° N.); existence of a high-arctic monsoon sub-zone north of 80° N. is claimed (p. 10). Zone distribution and types are schematically shown (text-map). ***Copy seen:*** DLC.

52278. KIERNAN, WILLIAM J., Jr. Modern triumph in the northern ice. (United States Naval Institute. Proceedings, July 1957. v. 83, no. 7, p. 742–52, illus., map.)

Transportation of oil and construction materials for the DEW Line sites in Canada was carried out by MSTS (Military Sea Transport Service) Arctic Operations 1955, with 126 naval and merchant marine ships, in two task forces, working from both Atlantic and Pacific. The operation of the Atlantic force, preparations, organization, equipment, also difficulties encountered during navigation and unloading, are described. Most of the naval vessels were winterized prior to departure, with special lubricating and tuning-up of equipment, installation of a cast steel propeller with stainless steel blades or nickel-aluminum bronze propellers, fitting of propeller iceguards, etc. First discharge stop was Coral

Harbour, Southampton Island; the unloading operation is described, and comments offered on the native population (especially health conditions) and American-Canadian personnel. During the voyage to two sites further northward, the ships, so long as they were not allowed to go dead in the water, could be navigated independently, and icebreaker assistance was seldom required in Foxe Basin ice. Many vessels suffered bow damage, however, and brittle fractures in equipment were a source of trouble before the return home on Oct. 1. The experiences are summarized in a discussion of the suitability of various types of small craft for arctic service, and pointers are given on how to beach a vessel in Foxe Basin. On the Pacific side, all but 11 of the 53 ships went east of Point Barrow. Losses and damages are reviewed, and the Operation's overall efficiency is stressed. ***Copy seen:*** DLC.

Iron deposits of Alaska. (*In:* International Geological Congress. 19th, *Algiers,* 1952. Symposium sur les gisements de fer du monde, t. 1, p. 413–23, map in atlas vol.) Refs.

Geologic descriptions of the known iron-ore deposits are given; they comprise millions of tons of ore deposited under a variety of conditions in widely scattered locations throughout the country. Magnetite, a replacement in contact metamorphism and in fracture fillings, is of greatest importance. Hematite is known in several places, and associated minerals are reported. Richness of samples and size of some ore bodies are indicated. No production is noted. ***Copy seen:*** DLC.

52286. KINOSITA, SEIITI. Breakdown of snow by impulsive force, 2. (Teion kagaku, 1956. ser A, v. 15, p. 149–69, illus., tables.) 11 refs. Text in Japanese. Summary in English.

Report of observations on the resistance offered by snow to the penetration of a falling body and of studies on the relation between the variations in resistance and snow stratification. The resistive force showed large, slow changes on which rapid changes were superimposed. The slow changes are attributable to the break-down of individual snow layers as the body sinks into the snow, while rapid changes are due to intermittent breakdowns taking place within each layer. A large increase in the supporting capacity of the snow compressed by the falling was also noted. The ratio between the mass of compressed snow and the energy absorbed by the snow is considered as a measure of snow softness.

Lands in northern Alaska withheld under Public Land Order No. 82, are to be opened for exploration in 1958; central province is in early stage of exploration; in southern Alaska, drilling increased four-fold in 1957. Exploration is expected to increase sharply in 1958. ***Copy seen:*** DGS.

52298. KISELEV, I. I. Termitnyĭ sposob razmorazhivaniîa merzlykh gruntov. (Stroitel'naîa promyshlennost', Jan. 1957. god 35, no. 1, p. 30–33, table, diagrs.) Ref. Text in Russian. ***Title tr.:*** Thermit method for thawing of frozen ground.

A method of digging frozen ground using Thermit for preliminary partial thawing is described in detail; complete thawing of the frozen layer is not necessary, since the mechanical strength of the lower strata at temperatures above −2° C. is low. Data on variations in strength with temperature and moisture are tabulated for sand, clay, and dry pulverized soils (for the temperature range from −0.5° to −10.3° C.). Frozen areas up to 25–35 cm. wide between thawed zones will not impede excavation. Combustion of Thermit (aluminum powder and ferric oxide) generates heat about 1,000 cal./kg. and develops a maximum temperature about 3,000° C. Thawing of 1m.³ of ground at temperature −10° C. requires about 4 kg. of Thermit: charges of 4 kg. each are usually placed in 1 m. lengths of steel pipe with special igniter, and the pipes lowered into wells drilled in frozen ground 1 m. apart by a special machine. The temperature of the thawed ground varies from +10° C. at center to +1° C. on the periphery. ***Copy seen:*** DLC.

52311. KLEIN, WILLIAM H. The circulation and weather of 1957. (Weatherwise, Feb. 1958. v. 11, no. 1, p. 7–11, 32–34, graph, 7 text maps.)

Summary of conditions in North America, especially the United States, by seasons. Maps showing mean sea-level pressure for Jan., mean 700-mb. heights for Aug. and Oct., and mean 700-mb. height departures from normal for Feb. minus those for Jan., include the North American Arctic. ***Copy seen:*** DWB.

52312. KLEIN, WILLIAM H. Principal tracks and mean frequencies of cyclones and anticyclones in the Northern Hemisphere. Washington, D.C., U.S. Govt. Print. Off., 1957. 60 p. text maps, diagrs. (U.S. Weather Bureau. Research paper no. 40.) 130 refs.

Portrays on maps, and discusses in text, principal tracks of cyclones and anticyclones at sea level; also shows geographical frequency of Lows, Highs, cyclogenesis and anti-cyclogenesis, by months for the entire year. Method of preparation of tracks is explained: their synoptic climatology discussed; mean meridional distribution and annual march of cyclone and anticyclone occurrence and genesis are related to the mean zonal circulation of the Northern Hemisphere at the 700-mb. level. Statistics are presented on relative frequency, average speed, and life span of pressure centers. Principal conclusions are offered in the charts and summarized (eleven items) in text. ***Copy seen:*** DN–HO.

Morphological and anatomical account of upper nasal canals of the larynx and pharynx of the Odontoceti and Mystacoceti. The function is reconstructed from the morphology. The peculiarities of these organs in the two groups of whales are emphasized.

Copy seen: DLC.

52316. KLEĬNENBERG, SERGEĬ EVGEN'EVICH. Ob okhrane morzha. (Priroda, July 1957, no. 7, p. 101–103, illus.) 10 refs. Text in Russian. ***Title tr.:*** Walrus protection.

Contains data on the morphology, biology, ecology and geographic distribution of walrus. Commercially the walrus is valuable for its tusks (ivory), hide, and oil. Owing to reckless slaughter by sealers and whalers, the stock is greatly decreased even in the arctic seas. The walrus rookeries on the coast of Chukotsk Peninsula, for instance, are reduced from 33 to three (in 1954). Strong protective measures were taken in 1956 by the Soviet government. Hunting of walrus is allowed only for kolkhozes of the Chukotsk Peninsula and northern regions of Yakut A.S.S.R.; but even for them the killing of females and young on the water is forbidden. ***Copy seen:*** DLC.

52317. KLEIVAN, HELGE. Eskimoenes skjebne på Labradors østkyst. (Grønland, Sept., Oct. 1957. nr. 9, 10, p. 347–55, 377–85, illus., map.) Text in Norwegian. ***Title tr.:*** The fate of the Eskimos on the east coast of Labrador.

Traces history of this group (now about 700) from 1771, when the Moravian Mission station at Nain was established. The climate and general geography of the area is described. Relations between these Eskimos and incoming whites are discussed. Health conditions, fishing, hunting and sealing activities, housing, education and missionary work are outlined. Conditions after 1942, when the Newfoundland government took over trade on the coast on a non-profit basis, are dealt with in the second section. Since 1949, when Newfoundland with Labrador became part of Canada, these Eskimos have received the federal social assistance as Indians and Eskimos elsewhere in Canada. Details are given on the welfare measures and comparisons made with conditions in Greenland.

Text in French. *Other authors:* M. Tanche *and* J. F. Cier. ***Title tr.:*** Adrenal medullary secretion in the struggle against cold.

Account of investigations on dogs exposed to temperatures of −5° to −20° C. Chemical thermoregulation (in the restricted sense) was manifest in secretion, by the adrenal medulla, of adrenalin and some noradrenalin. The former plays the main calorigenic role. ***Copy seen:*** DLC.

52323. KLIEGER, PAUL. Curing requirements for scale resistance of concrete. (*In:* National Research Council. Highway Research Board. Bulletin 150, 1957, *Effect of de-icing on vehicles and pavements,* p. 18–31, tables, graphs.) 2 refs.

Laboratory surface scaling and strength tests of concrete prepared from types I, II and III portland cement showed that non-air-entrained concrete has little resistance to surface scaling resulting from the use of de-icers. Prolonged curing raised the level of resistance, but failed to produce a level of satisfactory height. Air-entrained concrete has a high resistance to surface scaling resulting from use of calcium chloride as a de-icer, provided the concrete is adequately cured. Length of curing period is given for both types of concrete at 40° F. and 73° F. to obtain a level of strength sufficient for traffic loads. At 25° F. curing time was excessively long. In some cases adequate scale resistance was obtained, but concrete was unacceptable because of low strength. ***Copy seen:*** DLC.

52333. KNECHT, R. W. Statistical results and their shortcomings concerning the ionosphere within the auroral zone. (*In:* Polar Atmosphere Symposium, *Oslo*, 1956. v. 2, *pub.* 1957, p. 109–119, map, graphs.) 3 refs.

Problems involved in the summarization of high latitude ionospheric data are discussed, and typical problems illustrated by ionograms and data plots for a number of arctic stations. To make statistical summaries of the data more meaningful: soundings should be made every 15 min. with extra soundings at 5 min. before and after the hour; a gain run should be made each hour; the f-plot should be prepared regularly, and the number of values used in the computation and an estimate of the dispersion, such as the quartile range, should be published in addition to the median. These procedures, recommended by the URSI High Latitude Committee, Brussels, 1956, writer has found warranted by additional information available.

Discusses the phenomenon allegedly observed in Greenland that narwhals who have had their tusks broken, mend them by ramming the end of another narwhal's tusk into the hole. No conclusions are drawn but the evidence warrants investigation.

Copy seen: DLC.

52343. KNUTH, EIGIL, *Greve,* **1903– .** Archaeology of the farthest North. (International Congress of Americanists, 32nd. *Copenhagen,* 1956. Proceedings, 1958, p. 561–73, illus., diagr., sketch map.) 22 refs.

Discusses the geographic features and past climatic trends (based on driftwood accumulations) of Pearyland. Author's archeological field-work of 1947–1955 on Jørgen Brønlunds Fjord, Cape Holbaek (Danmarks Fjord) and Prinsesse Ingeborg Halvø is reviewed. A temporary division of the term Independence culture (cf. No. 35630) into Independence I and II (neither of them Dorset) is suggested, in view of possible future subdivisions. The older, Independence I, radio-carbon dated to 3840±170 years is likened to the Sarqaq culture of Disko Bay; the younger, Independence II, radio-carbon date 2830±130 years, is characterized as pre-Dorset. The archeological material (flint and bone implements, tent rings, fire places) is described and the absence of harpoon heads and such "important features of Dorset culture as slate, grinding, and lamps" or even soapstone is stressed. ***Copy seen:*** DSI.

(U.S. Quartermaster Research and Development Command. Environmental Protection Research Division. Technical report EP–39.) 10 refs.

Handbook for engineers and designers in establishing space allowances in the design and sizing of man-operated equipment. Data are given on the body size of the soldier clothed in full arctic uniform. As the criterion used is the 95th percentile of U.S. Army nude body size, the data are concerned with the upper size limit. The information is presented in pictorial form with index scales, so that dimensions can be measured on the pictures and referred to the index scale to establish actual size. ***Copy seen:*** DLC.

Biîlleten', nov. ser., otdel biol. 1957. v. 62, no. 3, p. 77–81, 2 illus., table.) 3 refs. Text in Russian. Summary in English. ***Title tr.:*** Distribution of antagonistic forms of fungi of the genus *Penicillium* in the soils of the European part of the Soviet Union.

Distribution from the Murmansk region to the moist, subtropical Batumi district is outlined. A regular rise in the proportion of antagonistic forms was observed from north to south, but the proportion fell noticeably with elevation of the terrain. Antagonistic penicilliums found in soils of northern and alpine districts include a large proportion of forms that produce penicillin. The proportion of these forms falls sharply in subtropical soil, and the fungi show a capacity of producing other antibiotic substances. The majority of the stamms producing penicillin belong to the series *P. chrysogenum* and *P. citrinum*.

Viscous compression of a snow cover is analyzed mathematically on the basis of measurements in 1955–56 of the thickness and density of individual snow layers made at five-day intervals. Viscosity values for the fragile snow when plotted against time, were similar to those of the hard, compacted snow of the previous winter, while a more rapid increase in viscosity with snow density was found in 1955–56 than in 1954–55. Microscopic observations revealed the presence of depth hoar crystals in the snow, connected with one another in the vertical direction, a phenomenon which may explain the fact that the fragile snow of 1955–56 showed the same viscous resistance as settled snow.—From SIPRE.

Ural'skii filial.) 63 refs. Text in Russian. *Other authors:* V. I. Nikulin, *and* V. I. Kharin. ***Title tr.:*** Khanty-Mansi National District; outline of its nature and economy.

The Khanty-Mansi (until 1940 the Ostyak-Vogul) National District was organized in Dec. 1930 as a part of Ural Province (which became in 1934 Ob'-Irtysh Province, during Dec. 1934–1944 Omsk and since Aug. 1944 has been Tyumen' Province). The District, covering 558 thousand sq. km., has 98,000 population (in 1939), of which only one-fifth are native Ostyaks (Khanty), Voguls (Mansi), Samoyeds (Nentsy) and Zyryans (Komi), four-fifths of the population being Russian. The main features of the District are outlined, chiefly on the basis of material gathered in 1950–52 by the Section of Economic Investigations (Otdel ėkonomicheskikh issledovanii) of the Ural Branch of the Academy of Sciences. Russian expansion and exploitation of the area and the progress of acculturation of the native population in the Soviet time are reviewed (p. 16–21). The geomorphology and geological structure and mineral resources, climate, river, lake and marsh hydrology, soil, vegetation, and fauna are outlined (p. 21–52). Fisheries and the fishing industry, forestry and the wood industry, also other, smaller branches of industry are described (p. 52–79). Agriculture, stock raising, reindeer husbandry and fur farming, hunting and trapping, and transport and communication are dealt with (p. 97–101). Data are given on the size, distribution and growth during 1930–50 of each branch of the economy; difficulties of economic development with the large area in virgin taiga and impassable marshes, are noted. Over 60% of the District's economy is based on fisheries, over 23% on forestry and only 15% on livestock, reindeer breeding and fur farming. The 2,288 fishers are organized in 196 teams (artel'); most of the collective farms and many state organizations are engaged in the fishing industry. Some 55 collective farms own 90,000 reindeer and over 7,000 silver foxes. Considerable deposits of natural gas (discovered in the Berezovo region), rock crystal, clay, quartz sand and immense deposits of peat are the main mineral resources. Rivers (the Ob' and its tributaries: Irtysh, Konda, Severnaya Sos'va, Vakh, Lyapin, etc.) and settlements (Khanty-Mansiysk, Berezovo, etc.) are described. District boundaries and its administrative divisions, also the dis-

tribution of industry are shown on maps; a list of literature is added.

Air temperature, Jan. 29–Feb. 1, 1956, in Moscow was −30° C., and at the drifting station North Pole-5 (86°30′ N. 90° E.) it ranged from −1° to −4° C. Synoptic conditions over the North Atlantic and Arctic Basin are analyzed and the exceptionally warm weather in the Arctic is attributed to the unusual distribution and movement of cyclones and anticyclones, which caused a flow of warm air masses from the Atlantic into the Arctic. ***Copy seen:*** DLC.

(Voprosy ėkonomiki, June 1957, no. 6, p. 135–40, table.) Text in Russian. ***Title tr.:*** The national economic importance of the diamond industry in Yakut A.S.S.R.

Six diamantiferous regions have been discovered in Yakutia: Malo-Botuobinskiy, Daldyno-Alakitskiy, Sredne-Markhinskiy, Tyungskiy, Munskiy and Severo-Olenekskiy. Development problems are discussed for each of these regions, including transportation, electrification, construction of buildings and water supply; a gradual development is suggested, beginning with the most promising and accessible, Malo-Botuobinskiy region. The Soviet Union's industrial diamond requirements are estimated at 7–9 million carats a year. There are prospects of meeting this demand by development of the Yakutia diamond fields.

Reviews the exploration of these islands (77°55′–81°16′ N. 91°–106° E.) from their discovery in 1913 till 1957, including author's sojurn May–Sept. 1950. Physical, especially climatic, conditions are described. The various plant associations analyzed and tabulated include those of lowlands, inland plateaux, river terraces, preglacial plateaux. The vascular plants (38 species) making up these complexes are tabulated with indications of their occurrence. Altogether 54 vascular plants were encountered, and they are systematically tabulated (p. 660–61) with note of their occurrence on islands of the archipelago, and some discussion of their geographic distribution in the area.

Reports results of authors' investigations sponsored by the Soil Institute and Institute of Agriculture of the far North and carried out during 1953–55 in the forest-tundra and taiga of the Salekhard, Berezovo and Khanty-Mansiysk regions on the banks of the Poluy, Sos'va and Irtysh Rivers. Changes in the properties of virgin soils were studied in five experimental plots cultivated and manured (100 tons/hectare/year) for vegetable growing. The amount of humus, also the composition of humic substances changed during the process of cultured soil formation, and this composition is a reliable indicator of the degree of cultivation. Application of micro-elements (copper and boron) to forest-tundra soils in the Salekhard region proved highly effective for forming cultural soils.

A general discussion of the (presumed) role of the nervous receptors in necrosis of frostbite. Their injury may cause nonspecific reactions from the central nervous system causing tissue necrosis in the frostbitten area. ***Copy seen:*** DNLM.

KOSKI, KALEVI, *see* Moorrees, C. F. A. The Aleut dentition . . . *1957*. No. 53386.

52425. KOSKIMIES, JUKKA. Flocking behaviour in capercaillie, *Tetrao urogallus* L., and blackgame, *Lyrurus tetrix* L. Helsinki, 1957. 32 p. map, tables, diagrs. (Suomen Riistanhoito-Säätiö: Finnish Game Foundation. Riistatieteellisiä jualkaisuja: Papers on game research, 18.) 50 refs.

Based on records (age, sex, date, locality) of 840 and 1,500 respectively of these two grouse during the autumns and winters, 1954–55 and 1955–56. The flocks represented by these samples exceed 20,000 in number; the records cover the entire country. Data on flock composition and size are given. Flocking proper begins in October: the capercaillie sampled in Sept. 1954 were 50% in flocks, the blackgame 70%, the others solitary; corresponding values for Jan. 1955 were 70% and 95%. Of all capercaillie observed in September, 81% were in flocks, in January, 95%; of blackgame 93% and 100% respectively. Both species tend to sex segregation in winter, and their flocking intensity increases from south to north. Coincident with flock formation, gonadal inactivity, open escape behavior, wider range of mobility and increased sociability occur in both species. The survival value of the flocking behavior and concomitant changes, is discussed. ***Copy seen:*** DA.

Bûlleten', nov. seriíâ, god. 129, t. 63, otdel geologicheskiĭ, Nov.–Dec. 1958. t. 33, vyp. 6, p. 43–57, table, diagrs.) 21 refs. Text in Russian. ***Title tr.:*** On the history of development of the western Verkhoyansk region and Vilyuy depression in the Upper Paleozoic and Mesozoic.

Outlines historical developments in this region and the adjacent platformic provinces (approx. 62°–68° N. 118°–136° E.) during the Lower Permian and Upper Cretaceous periods. Two large-scale cycles, Upper Paleozoic and Mesozoic, are distinguished and treated in detail, the various ages identified, cross-sections examined and stratigraphic division presented. Lithologic complexes and facies of various formations are outlined and compared. ***Copy seen:*** DGS.

52434. KOSSOVSKAÍÂ, A. G., *and* V. D. SHUTOV. Kharakter i raspredelenie mineral'nykh novo-obrazovaniĭ v razreze mezo-paleozoĭskikh otlozheniĭ zapadnogo Verkhoíân'ia. (Akademiíâ nauk SSSR. Geologicheskiĭ institut. Trudy, 1956. vyp. 5, p. 135–68, 11 plates, 2 diagrs.) 7 refs. Text in Russian. ***Title tr.:*** Characteristics and distribution of newly formed minerals in cross-section of Mesozoic-Paleozoic deposits in the western Verkhoyansk region.

Presents results of investigation on minerals newly formed under the influence of epigenesis and metamorphism. Profiles between Sangar and Kitchan on the right bank of the Lena and on the Tumara, Kele, and Boraya, tributaries of the Aldan, were investigated and petrographic characteristics of neogenic mineralization are described. Two factors are believed mainly responsible for the mineralization: (a) the intitial composition of the sedimentary rocks, and (b) their position in the profile determining the degree of their compression. In summarizing his results, the writer distinguishes four stages of neogenic mineralization originated by epigenesis and metamorphism. Processes of this mineralization and their effects are diagrammed (p. 160, 162); newly formed minerals are illustrated by photos.

Text in Russian. ***Title tr.:*** Methods of search and exploration of iron ore layers in the Angara-Ilim region.

Criticizes methods used and recommends a new approach: geologic mapping was done only in small scale; airphoto survey, geobotanical and hydrochemical methods were not applied. More attention should be paid to the individual volcanic pipes, geologic structure, gravimetric anomalies, and geophysical methods in order to discover new ore locations of this region (approx. 56°–58° N. 102°–104° E.). ***Copy seen:*** DLC.

52440. KOTILAINEN, MAUNO JOHANNES, 1895– . Einige Ausbreitungsprobleme der Weiden, besonders der *Salix pyrolifolia* Led. (Botaniska notiser, 1958. v. 111, no. 1, p. 341–52, 3 illus.) 26 refs. Text in German. ***Title tr.:*** Some distributional problems of the willow, especially *Salix pyrolifolia* Led.

Deals with the peculiar disjoint distribution of *Salix pyrolifolia*, which grows in European arctic Russia (in the Pechora estuary about 68° N. and on Kanin Peninsula at 66°–66°30′ N.), in Siberia on the Lena River about 69° N., and eastward to the Chukotsk Peninsula. But it is not known from Kamchatka, the Okhotsk Sea coast or Sakhalin Island. It also grows in Scandinavia (Kuusamo) and adjoining regions of the Kola Peninsula. ***Copy seen:*** DLC.

52441. KOTILAINEN, MAUNO JOHANNES, 1895– . The *Stratiotes* lakes in Kittilä, Finnish Lapland, as a floristic and Quaternary problem. (Botanisk tidsskrift, 1954. bd. 51, p. 141–56, illus., table, maps.) 18 refs. *Also pub.* in German in Suomalainen tiedeakatemia, Helsinki. Sitzungsberichte 1954, p. 119–31.

Study of the distribution of *Stratiotes* and associated plants in the lakes and bogs of northern Finland. The present-day occurrence of *Najas flexilis, Stratiotes, Ceratophyllum* and eutrophic hydrophytes could be, even in the North, to a considerable extent a relict from the climatically favorable Aleröd period, the plants surviving only in basins rich in electrolytes, or in slightly brackish waters. Data on species and lakes studied in Kittilä are tabulated and mapped. This paper is not based on Quaternary studies but on a field botanist's knowledge of the area and on recent distribution of the eutrophic flora. The exceptional conditions are hard to explain except by the Aleröd period. ***Copy seen:*** DA.

Moskva, 1942. vyp. 1, p. 13–31, illus., tables, diagrs., graphs.) Refs. Text in Russian. ***Title tr.:*** Physical and mechanical properties of the snow cover.

"The structure of snow varies depending on the duration of the snow cover, the moisture content, temperatures, and pressures applied. The thermal conductivity coefficient ranges from 0.0002 to 0.0035 cal./cm. sec. degree for snows varying in specific densities from 0.15 to 0.7. An increase in the density as a result of recrystallization was found possible through a volumetric deformation at temperatures close to 0° C. The increased density is explained as a function of time during which a constant pressure is applied. The density of snow depends on its temperature, the initial pressure, and external mechanical action. Instruments to determine the density and the hardness consist of spring scales equipped with known specific volume cylinders and IMASh harness meters."—SIPRE. ***Copy seen:*** DLC.

Account of experiments with pigeons. An increase in ventilation and possibly O_2-consumption was observed during periods of light, independent of overt activity. Enucleation or removal of cerebral hemispheres abolished these responses to light. ***Copy seen:*** DLC.

52461. KRANCK, ERNST HÅKAN, 1898– . Väinö Tanner, minnestal vid Finska vetenskaps-societetens möte den 19 januari 1953. Helsingfors, 1953. 10 p. photo. (Finska vetenskaps-societeten. Årsbok-vuosikirja, 1952–1953. v. 31, C, no. 2.) Text in Swedish. ***Title tr.:*** Väinö Tanner, memorial speech at the Finnish Scientific Society's meeting, January 19, 1953.

Tribute to the Finnish geographer Tanner (1881–1948) with account of his scientific activities. Trained as an engineer and influenced by the geologists Sederholm and Ramsay, Tanner studied Quaternary geology in Lapland and the coastal region for 25 summers; contributed to mining studies at Pajala, Sweden, and Petsamo, Finland, served on the International Commission on Reindeer Problems, and after World War I, in the Finnish diplomatic service. He became professor of geography at the University of Helsinki; his continued interest in changes in sea level led to expeditions to Labrador in 1937 and 1939. His interest in Lapland and Labrador natives at the end of their isolated ways of life is noted. His ability to present field observations makes his geologic-geographic reports valuable as source materials, though some of his conclusions are debated. His major works are cited.

Trudy, Materialy po izucheniîu Kolymsko-Indigirskogo kraîa, ser. 2, geologiîa i geomorfologiîa, vyp. 9.) 25 refs. Text in Russian. Summary in English. ***Title tr.:*** The Precambrian and Cambrian of Kolyma Land.

Preliminary study of extensive geological materials collected in 1933–35 by Upper Kolyma Expedition sponsored by State Trust Dal'stroĭ. Two formations of Precambrian rocks and two formations of (supposedly) Cambrian rocks, covering altogether approx. 6,000 sq. km., were found on the right bank of Kolyma, in the region of Bol'shaya Stolbovaya and Bol'shaya Shamanikha Rivers, and on the left bank, in region of Popovka River and Arga-Tas Range. Tectonics, stratigraphy and petrography of these strata are described and their mineralogy is outlined. Occurrence of Precambrian and Cambrian rock formations in northeast Asia and northwest America, including New Siberian Islands, Chukotka and Alaska, is noted in introduction (p. 5–11).

Discusses principal results deduced from observations of internal waves on basis of the literature and investigations by the *Anton Dohrn*, 1956–1957, off the Norwegian coast at about 70° N. and in the Denmark Strait. Wave lengths in the northern North Atlantic vary from 25 to 30 km.; max. recorded amplitude is 300 m. It is often difficult to ascertain whether the observed variations are due to waves, vorticity, or turbulence. Analysis of periods indicates that internal tides and inertia oscillations may predominate. Oscillations of several hundred meters, following the tidal rhythm and possibly also conditioned by meteorological processes, frequently occur in the northern North Atlantic. ***Copy seen:*** DN–HO.

52480. KREĬDA, N. A. O pochvakh vostochno-evropeĭskikh tundr. (Pochvovedenie, Jan. 1958, no. 1, p. 62–67, tables.) 9 refs. Text in Russian. Summary in English. ***Title tr.:*** Soils of the East European tundras.

Contains an outline of soils based chiefly on author's investigation in the Kanin-Timanskaya, Malozemel'skaya and Bol'shezemel'skaya tundras in 1952–55. Three soil sub-zones are distinguished: "arctic" in the southern part of Novaya Zemlya, Vaygach Island and Kara Sea coast at Yugorskiy Shar Strait; "northern" in the northern part of Malozemel'skaya and Bol'shezemel'skaya tundras; and "southern" in the rest of area as far as the northern forest line. Data on the chemical composition of various soils in northern and southern sub-zones are given (tables 1–3). Processes of soil formation are discussed. The main features of tundra soil formation are a superficial gleyization under the influence of biochemical factors and a periodic translocation of soil-formation products along the soil profile. This may be explained by infiltration of precipitation during the warm period of the year and the freezing out of water into the upper soil horizons in autumn and winter. A small degree of podsolization or a cryptopodsolization is occasionally found in tundra soils; it is not, however, a result of a recent process, but a relic of the soil-formation processes at the time of the climatic optimum of the post-glacial period.—From author's summary.

Summary of observations on five men who lived scantily dressed and covered at 60° F. preceded and followed by control periods at 80° F. Continuous skin and rectal temperatures are compared with each other and evaluated. Evidence of acclimatization is discussed.

Copy seen: DNLM.

52482. KREIDER, MARLIN BOOKS, 1922– . *and others.* Oxygen consumption and body temperatures during the night. (Journal of applied physiology, May 1958. v. 12, no. 3, p. 361–66, illus., tables.) 20 refs. *Other authors:* E. R. Buskirk *and* D. E. Bass.

Nine young men sleeping in a "comfortable" environment (25.5°–27.8° C.) showed significant decreases in O_2 consumption, rectal and weighted skin temperature. Vo_2 reached a minimum 5.1 hrs., T_r (rectal temperature) 5.6 hrs. after retirement. Skin temperature first rose slightly then decreased slowly. Inter- and intra-individual variations were noted.

52484. KREIDER, MARLIN BOOKS, 1922– , *and* E. R. BUSKIRK. Supplemental feeding and thermal comfort during sleep in the cold. (Journal of applied physiology, Nov. 1957. v. 11, no. 3, p. 339–43, illus. table.) 6 refs.

Account of observations on six men given a supplemental meal of 600 or 1200 cal. before retiring to the sleeping bags at a temperature of −30° F. As a result rectal and toes temperatures and O_2 consumption were higher than in controls, but mean skin temperature remained unchanged. The supplement also reduced wakefulness and discomfort due to cold. ***Copy seen:*** DNLM.

Årsberetning vedkommende Norges fiskerier, 1949, *pub.* 1950, no. 7, p. 97–102, diagr.) Text in Norwegian. ***Title tr.:*** Experiments with nylon in fishing and sea-hunting gear.

Strength and durability of nylon recommend it for use in nets and lines. Catches of fish and small whales, with equipment of nylon and comparable materials, are compared. Results with nylon are better in some instances but no conclusions are drawn. ***Copy seen:*** DLC.

52506. KRISTENSEN, M. O. Forsøksdrift med motortrålere av størrelse 75–100 fot. (Norway. Fiskeridirektoratet. Årsberetning vedkommende Norges fiskerier, 1949, *pub.* 1950, no. 7, p. 58–87, illus.) Text in Norwegian. ***Title tr.:*** Experimental operation of 75–100 foot motor trawlers.

Describes experimental trawling off Bjørnøya and eastwards into Barents Sea in 1947 with two vessels modified under Fisheries Dept. supervision. Poor catching conditions, untrained personnel and repeated breakdowns in equipment prevented conclusion as to economic advantage, but technically, the 95-foot vessel was found suitable for the Barents Sea banks; a smaller action radius is recommended for the 75-foot vessel. Motors of 300 hp. and 150 hp. were found to be above minimum requirements, but pitch-propeller and a coupling between motor and axis are suggested. Outboard iron plates and a strengthening of main deck are necessary requirements for wooden vessels. Models of a Norwegian-made trawl were tried out with good results.

Text in Russian. ***Title tr.:*** Factors determining the limits of birch and spruce in the Khibiny Mts.

Results of author's observations in the valley and on slopes of Yukspor in summers of 1955 and 1956. The present forest (spruce and birch) line on the southern slope is at 470 m., and on the northern slope at 400 m. above sea level; the upper limit of the subalpine belt (dwarf birch) goes to 600 m. Detailed data are shown (tables, diagram) on tree growth at these limits in relation to the temperature of air and soil and to the moisture of soil. The tree and forest lines tend to advance due to the warming trend in climate; but lack of moisture restricts somewhat this tendency. The question of present-day advance or recession of tundra is discussed without conclusion. Author's work was sponsored by Khibiny Geographical Station of the Moscow University. ***Copy seen:*** DLC.

52512. KRÎUKOV, S. M., *and* **D. V. LEVIN.** Ob ispol'zovanii samoletov tipa Il–14 dlîa aèromagnitnoĭ s"emki. (Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Informatsionnyĭ biûlleten', 1958. vyp. 10, p. 53–59, diagrs.) Text in Russian. ***Title tr.:*** On the use of the Il-14-type aircraft for aeromagnetic survey.

The Li-2-type airplane was used for the aeromagnetic survey at scale 1:1,000,000 of the arctic regions in the U.S.S.R. until 1956. Its fuel consumption was too high and it did not have the necessary speed; so in 1956–57 the Il–12 was introduced, and in 1958 the Il–14. Use of the Il–14 substantially increased the coverage and the survey was completed. The magnetometer can be attached to aircraft, and gondola is not needed. Detailed data are given on the Il–14 and on the magnetic survey. ***Copy seen:*** DGS.

Gorno-geologicheskiĭ institut. Trudy, 1957. vyp. 28, p. 17–33, diagr.) 22 refs. Text in Russian. ***Title tr.:*** The stratigraphy of Upper Cretaceous and Paleogene deposits of the eastern slope of the north-central Ural and Trans-Ural, according to the diatomaceous algae.

Reports results from an investigation of diatomaceous algae collected in 1949 over this broad region, with special attention to the Ivdel' district (60°24′ N. 60°24′ E.) and Serovsk farther south. More than 1500 samples from over 100 drill holes were studied, and materials mostly of these districts, and of Senonian and Tertiary periods only, are reported here. The algal studies were by a method developed by A. P. Zhuze. A new stratigraphic division is proposed and comparison made with other divisions.

52521. KROTOV, MODEST ALEKSEEVICH. Na severe dal'nem. Moskva, Sovetskaâ Rossiâ, 1957. 214 p. plates. Refs. Text in Russian. ***Title tr.:*** In the far North.

Describes the physical conditions, resources, economic activities of Yakutia. Its size, population, main geographic features, climate and permafrost are outlined. Development of agriculture, hunting and trapping (sable, squirrel, arctic

fox, ermine, etc.), muskrat acclimatization, and fur farming are described (p. 34–47). The forests and wood industry (p. 48–53), gold, mica, diamonds and other minerals and their development (p. 54–72), road, river and air transportation are discussed (p. 73–84). The Lena River valley is described, its landscape, floods, etc. (p. 84–93). Mammoth finds, ivory, and native bone carvers are mentioned (p. 94–101). Discovery and explorations of the area, mapping and glacier studies, the problem of hypothetical lands are sketched (p. 102–131). Russian political exiles of earlier years and their influence on the development of Yakutia are dealt with at some length (p. 146–214). Progress of Yakutia is stressed in a preface (p. 3–8) by A. Danilova. ***Copy seen:*** DLC.

Popular sketches of the history, geography, ethnography, exploration, economic conditions, acculturation and industrialization of Yakutia, occasioned by the 325th anniversary of its incorporation into Russia. The influence of exiles in the pre-Revolutionary period and events in the establishment of the Soviet rule in Yakutia are stressed and leading persons are characterized. Discovery of gold in the Aldan and diamonds in the Vilyuy basin (p. 328–80) is recounted; development of river, sea, land and air transportation in Yakutia is outlined. Transfer is noted (p. 391–92) of four river steamers from Arkhangel'sk to Yakutsk under F. V. Naîanov Aug. 17–Sept. 26, 1952. ***Copy seen:*** DLC.

Arkhangel'sk, Arkhangel'skoe knizhnoe izd-vo, 1957. 68 p. illus., tables. Text in Russian. ***Title tr.:*** A transformed region; the socialist transformation of the Nentsy National District during the years of the Soviet regime.

Outlines the economic, industrial and cultural development of northeastern part of Arkhangel'sk Province, including Kaninskaya, Timanskaya, Malozemel'skaya and Bol'shezemel'skaya Tundras, also Kolguyev and Vaygach Islands, inhabited chiefly by Nentsy (Samoyeds). Primitive living conditions in pre-Revolu-

tionary times, organization of the National District in 1929, rise of Nar'yan-Mar (12,000 inhabitants) and other population centers, the achievements of 14 reindeer-breeding collective farms and of three state farms are reviewed (p. 9–33). Work of the Nar'yan-Mar Agricultural Experimental Station, development of fisheries and 27 fishers' collectives (p. 32–45) are outlined. Acculturation of the native population, development of schools and health service are described (p. 46–58), and some outstanding and representative Samoyeds are characterized. Natural resources of the area are rich and the development prospects are good. At the beginning of 1957, the population of the district passed 39,000; its main sources of income are reindeer breeding, fisheries and hunting. In spite of some progress in agriculture, only 163.9 hectares were under cultivation in 1955; cattle increased from 3,310 in 1932 to 7,938 in 1956. The 16 fur bearers of the district, which has 19 million hectares of hunting grounds, include arctic fox, ermine, muskrat and squirrel and the fur take has increased 75 fold since 1930. Fish caught in 1956 amounted to 87,237 cwt., as compared with 13,485 cwt. in 1931. ***Copy seen:*** DLC.

1958. bd. 80, häfte 2, no. 493, p. 226–34.) 19 refs. Text in Swedish. Summary in English. ***Title tr.:*** On the conception of Vojtja conglomerate, Ro conglomerate, and Mesket lava in the Caledonian mountain range of Västerbotten county.

The terms Vojtja conglomerate and Mesket agglomerate have become widely used in descriptions of northern Swedish mountain geology since 1922. Vojtja conglomerate has become a common term describing quartzite conglomerate. Mesket agglomerate, or the Mesket series, includes volcanic rocks with sedimentary intercalations. It is now recognized that rocks included in each group differ in age. In the type locality, the Mesket is now recognized to be probably lower Ordovician and should retain the original name. The name Seima series is proposed for similar rocks lower to middle Ordovician in age. The Vojtja conglomerates are proposed to be separated into three groups: the Gimja of about middle Silurian age; the Vojtja at the Ordovician-Silurian boundary; and Rotik for serpentine conglomerates of lower Ordovician age. The term Ro conglomerate had been introduced earlier for serpentine and quartzite conglomerates of the same age. Outcrops of these rocks are common in the Lapland mountain region.

Lamont Geological Observatory, Contract AF 19 (604) 1891, final report.) 13 refs. *Other authors:* B. J. Giletti, *and* G. P. Erickson.

Results of reconnaissance study of limited number of snow and ice samples, collected in summer 1956 at SIPRE Site 2 (Fist Clench) about 220 mi. east of Thule, and from a traverse across the icecap; glacial meltwater samples were analyzed at Thule, Sondrestrom and Narsarssuak Air Force Bases. Sr^{90}, absent prior to 1950, had nearly doubled each year since 1952. Total integrated Sr^{90} fallout at Site 2 was estimated at one millicurie per sq. mi., compared with 20 mc./mi^2 in eastern United States. Enrichments of O^{18} and deuterium were found to be parallel in snow and ice samples from the center of the icecap; tritium concentration exhibited considerable range, vertical profiles (ice) showed a decrease in T:H, while surface (snow) T:H in 1956 was about five times that for 1955; meltwaters had considerably less tritium than snow in 1956.

52580. KURTÉN, BJÖRN. Sex dimorphism and size trends in the cave bear, *Ursus spelaeus* Rosenmüller and Heinroth. Helsingforsiae, 1955. 48 p. 10 illus., 8 tables. (Acta zoologica fennica, no. 90.) 39 refs.

Contains a study of fossil and recent populations of bears (*Ursus spelaeus, U. arctos* and *U. maritimus*) with quantitative data on sex dimorphism. The dimorphism is especially strong in the size of the canines, less pronounced in skull dimensions, and still less in the cheek teeth. Evolution in size of the bears was extremely rapid in the Quaternary. Simple adaptation by phyletic growth to cold climate was not the sole factor involved. The rapid rate was probably made possible by means of gene transport from neighboring populations. The study is partly based on a collection of recent *Ursus maritimus* from Greenland. ***Copy seen:*** DLC.

Reports the completion of a map of the peoples of the U.S.S.R. (karta narodov SSSR) in scale 1:5,000,000 for use in secondary schools. Prepared by a team

of cartographers headed by P. E. Terlefskiĭ, it shows the territorial distribution of 82 nationalities and ethnic groups. Areas of a single ethnic group and a mixed population are differentiated; those of low population density are distinguished: in those of the hunting and reindeer herding peoples of the Far North, only places of annual migration and hunt are hachured. The map is based on the 1926 census, but with corrections, as to recent migrations and changes in ethnic composition, based on investigations to 1950.

52584. KUSUNOKI, KOU. The present situation of sea ice observation in Japan. (*In:* Arctic Sea Ice Conference. Proceedings, 1958. p. 39–47.) 20 refs.

Japanese studies on sea ice since 1892 (cf. No. 40892, 45000–45003, 46177) are reviewed, and present observation and reporting methods are described. Standard observations are made daily Dec.-April, at about 30 shore stations and lighthouses, and are complemented since 1957 by aerial surveys. The phenomena observed include: the development and decay of the ice, bearing and distance to ice and water features, total ice concentration, concentration by ice types, types of ice, ice thickness and surface relief, and ice drift. The terminology of the International Ice Nomenclature is used. Data are sent to Otaru, whence forecasts are issued a few days in advance. The code for shore stations of the Hakodate Marine Observatory is included.—From SIPRE. ***Copy seen:*** DN–HO.

Reviews (for 1954–1957) geologic mapping at scale 1:200,000, the material collected by the Vilyuy and Amakin expedition, and air photo interpretation in the area (65°20′–68°40′ N. 113°–122° E.). In the various horizons of Cambrian formation six tectonic structures are distinguished and briefly characterized. ***Copy seen:*** DLC.

52586. KUTUZOV, NIKOLAĬ IVANOVICH. Zapiski izyskatelia. Moskva, Izd-vo "Molodaia gvardiia," 1957. 270 p. illus., plates, map. Text in Russian. ***Title tr.:*** Memoirs of a surveyor.

In 1933–37, the author headed the survey party for a highway from Magadan to the upper Kolyma and Indigirka Rivers. Between Strelka and the Nera River, the road was to run through virgin mountain taiga, almost uninhabited and virtually unmapped. The party's topographic reconnaissance, general determination of the route, locating of the road and making blue prints for the construction party are recounted. The primitive, though improving, working and living conditions are described: difficulties of transportation and supply, hardships of the wintering, coping with engineering problems posed by a rugged terrain, crossed by deep ravines, with steep slopes, the struggle with marshes, land slides, permafrost and naleds, etc. The local inhabitants (Yakuts) and hunting and fishing adventures are noted. A considerable supply of alcohol and its salutary effect in fatigue and sickness are noted. Schematic map of the area (p. 6) shows the party's route.

Methods employed at the Noril'sk Industrial Combine (located in a mountain area) are described; various snow fences are illustrated; and air-flow diagrams are presented. The principle of the active method, which is most effective at wind speeds not exceeding 8 m./sec. is to accelerate air flow at the bottom of the fence so that it will carry the snow across the area to be protected. Built without angle brackets and provided with deflectors at the top (on the windward side), such fences may be installed at angles as low as 20° to the wind. Portable snow shields are installed 50–70 m. in front of the fences and at a slight angle thereto to increase effectiveness during weak winds. Higher fences are used with a ground clearance of up to 3 m. on slopes of more than 45°. The vertical inclination can be varied from 0° to 45°. The fences are installed three m. from the center of railways and on the outer fringe of roads or at the foot of embankments. During storms, snow is transported 6–8 m. and deposited beyond the roads.—From SIPRE.

Text in Russian. Summary in English. ***Title tr.:*** Long-term changes in biological properties of some White Sea invertebrates.

A study of invertebrates with long life cycles (mainly bivalves and cirripedians) led the author to the conclusion that within the past hundred years or so, there occurred in the White Sea a decline in their range, growth and longevity and the degeneration or disappearance of some species. These changes he attributes to the mouth of this sea becoming shallow, which caused an increase of temperature and salinity ranges, and to an increase of O_2-deficiency due to accumulation of organic sediments. He suggests that these changes may have similarly affected some fish and fisheries.

Describes a probe built and used at Barrow, northern Alaska, 1952–53 for several hundred determinations *in situ* of the thermal conductivity of naturally frozen and thawed soils, snow, freshwater ice, and sea ice. About 20 in. long, ¼ in. in diameter, it contains a small bead thermistor as the temperature-sensitive element. Under normal field conditions, conductivity determined is reproducible within about two percent; absolute accuracy is estimated to be within five percent. A modification in design is expected to enable simultaneous determination of thermal conductivity and thermal diffusivity *in situ*. Results of a test made in frozen gravel fill are presented to illustrate the method of handling the data.—From author's abstract.

52613. LACHENBRUCH, ARTHUR HEROLD, 1925– . Thermal effects of the ocean on permafrost. (Geological Society of America. Bulletin, Nov. 1957. v. 68, no. 11, p. 1515–29, 8 diagrs., 2 tables.) 15 refs.

"In high latitudes the large difference between the mean annual temperature of the ground surface and in the unfrozen sediments beneath bodies of water can affect ground temperatures to depths of several hundred feet (e.g. in Alaska). The effect is of particular interest near the edge of the ocean where it depends upon the magnitude of the temperature difference between the land surface and ocean bottom, the thermal properties of the ground materials, and past changes in climate and/or shore-line configuration. Theoretical considerations suggest that, except where there are transgressing shore lines, permafrost to depths greater than 100 feet beneath the ocean bottom is not to be expected at points farther than a few thousand feet offshore. Similar considerations indicate that geothermal installations along the arctic coast can give information regarding post-Pleistocene shore-line changes. The geothermal effects of bodies of water offer an explanation for the anomalously large outward earth-heat flow recently reported by A. D. Misener [No. 41424] for Resolute Bay, Cornwallis Island, N.W.T., Canada."—Author's abstract.

52614. LACHENBRUCH, ARTHUR HEROLD, 1925– . Three-dimensional heat conduction in permafrost beneath heated buildings. Washington, D.C., U.S. Govt. Print. Office, 1957. 69 p. tables, graphs, 3 diagrs. in pocket. (U.S. Geological Survey, Bulletin 1052–B.) 3 refs.

Presents two theoretical methods for evaluating transient principal temperature disturbance and equilibrium seasonal effects in semi-infinite homogeneous medium in which surface temperature varies sinusoidally, but with different mean temperatures and amplitudes inside and outside a surface region of arbitrary shape, and the application of the methods to problems of foundation engineering in

permafrost areas. Both graphical, the first method involves summing integrated contributions to the temperature; the second involves a graphical integration with respect to solid angle. The methods apply to other thermal problems in permafrost as, for example, disturbance caused by the presence of a roadway.

52615. LACKEY, EARL EMMET, 1878– . A graphic method for assessing hourly temperature probabilities. Natick, Mass., Mar. 1957. 18 p. 5 graphs, 7 tables, map. (U.S. Quartermaster Research and Development Center. Environmental Protection Research Division, Technical report EP–46.) 3 refs.

Contains a short-cut method for predicting the percentage of time that January temperatures at individual weather stations in interior Alaska will probably be at, or below a given level. A straight line probability scale was constructed utilizing hourly temperature frequencies in January for eight selected Alaskan stations for the period 1950–1954. This "adjusted probability scale" is compared with actual data for Fort Greely and shows good agreement. The scale can also be used for Fort Churchill and Anchorage as well as more southerly stations. Possible further studies and refinements are briefly outlined.

52616. LACKEY, EARL EMMET, 1878– . A method for assessing and mapping the January daily minimum temperatures of northern North America. Natick, Mass., May 1958. 32 p. 6 text maps, diagrs., tables. (U.S. Quartermaster Research and Development Center. Environmental Protection Research Division. Technical report EP–88.)

Describes a simple, graphic method of determining and mapping the probabilities (in days/month or in percentage days/month) for any given minimum temperature in northern North America; it may be used for any month. Data required are: mean daily minimum, absolute minimum, and length of record. Frequency or percentage distribution of daily minimum temperatures for a station may be calculated quickly by use of these data and an adjusted probability scale. Method of establishing and using this scale is explained and illustrated. It was used to estimate daily minimum probabilities for 71 stations in northern North America. Five maps show how the table may be used to give an overall estimate for the whole arctic area, featuring any selected temperature frequency. Appendix shows method of obtaining similar, but less accurate, results from mean monthly temperature.

52617. LACKS, HYMAN, *and others.* Ice adhesion apparatus and test method. (American Society for Testing Materials. Bulletin, Sept. 1957. no. 224, p. 48–50, illus., tables.) 5 refs. *Other authors:* M. Quantinetz *and* A. Freiberger.

During search for a coating to prevent ice formation on decks and superstructures of ships, an apparatus which provides capacity for routine testing of large numbers of test panels, was developed. Coatings are applied on mild steel specimen panels, which are demagnetized and electrically grounded. Distilled water is frozen to the surface, and the applied force required to shear it from the panel, is measured. Uncontrolled experimental error in tests was calculated to 11%.

52620. LA FAY, HOWARD. DEW Line, sentry of the far North. (National geographic magazine, July 1958. v. 114, no. 1, p. 128–46, illus., map.) 2 refs.

Describes the Distant Early Warning

Line: its purpose, physical makeup, problems overcome during construction, life on the Line, and changes it has made in the Arctic. Completed in July, 1957, on a 3,000-mile arc from western Alaska to Baffin Island, the radar installations can detect enemy planes approaching Canada and the United States. Each of its six sectors covers roughly 500 miles and consists of a main station, auxiliary stations, and intermediate stations ("I-sites"). For buildings, module "trains" with wooden panels mounted on pilings to let snow blow under were devised. Communication difficulties were solved by the Forward Propagation Tropospheric Scatter; at most stations, beds of gravel beneath installations prevent permafrost unstability. Problems of white-out, polar bears, high wind, transportation of materials are described; also drifting snow, protection of radar antenna, boredom of isolated personnel.

52624. LAGOW, H. E., *and others.* Rocket measurements of the arctic upper atmosphere. (Annales de géophysique, Apr.–June 1958. v. 14, no. 2, p. 131–39, illus., 8 diagrs.) 9 refs. *Other authors:* R. Horowitz *and* J. Ainsworth.

Study of the structure of the arctic upper atmosphere as measured by rockets in the summers of 1953 and 1954. Tentative results are reported for two Aerobee-Hi rockets fired at Fort Churchill, Manitoba, winter 1956 and summer 1957. Comparison of results shows: at 200 km., atmospheric density at 59° N. lat. in daytime in summer is 2.5 times the winter daytime value; the summer daytime value 15–20 times the winter night-time value. The summer daytime value is 6.5 times the corresponding White Sands value of 1.4×10^{-7} gm./M^3. Between 30 and 45 km., density measurements indicate that seasonal and latitude variations are less than 10%; summer measurements show arctic temperatures and pressures to be significantly higher

than White Sands values. This meridional pressure gradient leads to an easterly geostrophic wind, in general agreement with anomalous sound propagation and high altitude balloon measurements.

52629. LAKTIONOV, ALEKSANDR FEDOROVICH. The effects of ice upon shipping routes, sea and river ports and the means to combat it. (*In:* International Congress of Navigation. 19th, *London,* 1957. Section 1, Inland navigation, Communication 3, pub. 1958?, p. 177–217, illus., table, diagrs., maps.) Refs. in text. "Prepared by M. K. Fedorov, I. S. Peschansky, T. I. Sandzheevich, I. M. Konovalov, B. B. Balanin and B. S. Borodkin."

Types of ice and ice formations, ice thickness, navigation season and difficulties, etc. are outlined for major inland

waters and seas bordering the U.S.S.R., including the White, Barents, Kara and other arctic seas, Bering and Okhotsk Seas; methods and means of ice observation are dealt with; symbols used in ice charts are illustrated. Basic data are presented on the ice regime of the nation's rivers (in particular, the Lena and Volga); the influence of various types of ice on navigation and operation of hydro plants is outlined. Several formulae for practical application of heat exchange data are presented; physical properties of sea and river ice are tabulated and discussed. Means of combatting the ice (ice-breakers, blasting operations, pneumatic installations, utilization of solar radiation to melt channels) are described for specified seas, rivers, and ports; protection of ships and port structures, and salvage of ice-bound vessels are discussed. Ice forecasting methods for the Northern Sea Route are outlined; a formula for forecasting ice thickness is presented. ***Copy seen:*** DLC.

52630. LAKTIONOV, ALEKSANDR FEDOROVICH. Ice observation methods. (*In:* Arctic Sea Ice Conference. Proceedings, 1958. p. 48–56, 4 illus., 5 diagrs., 2 text maps.) 48 refs.

Present Soviet ice-surveying procedures and instruments are described. Aerial observations are made periodically to determine ice conditions in all seas throughout the year. More detailed ice research is conducted by ice-hydrological patrols, which investigate the ice edge and make repeated standard hydrological sections during the navigation period. Ice concentration is determined with Gakkel's graphical scale; ice forms and types are distinguished according to special atlases. Coastal observations are made daily, and additional data are gathered from advanced ice posts, ice-profiles, and observations along routes in the region of coastal stations. Ice thickness is measured directly from the ice with various instruments and from the deck of a vessel with ordinary field glasses or an optical device, essentially a metal rod (60 cm. long) graduated at 2-cm. intervals, and a plexiglass plate with a reticule graduated at 1-cm. intervals traveling along the rod. Ice thickness is determined with an accuracy of 3% by counting the reticule points corresponding to the thickness of the floe viewed through the plate. The speed of ice drift in the open sea is determined either by the lead method, a driftograph, or radio-beacons, set up on drifting ice; the direction of drift is determined by means of an azimuthal dial. Aerial photography is used extensively in the study of various ice characteristics.—From SIPRE. ***Copy seen:*** DN–HO.

52631. LAKTIONOV, ALEKSANDR FEDOROVICH. Primenenie aviat͡sii v okeanograficheskikh issledovanii͡akh v Arktike. (Problemy Arktiki, sbornik statei, 1957. vyp 2, p. 19–31, tables, map, diagr.) 19 refs. Text in Russian. Translated into English for the Geophysics Research Directorate, Cambridge Research Center, U.S. Air Force, by the American Meteorological Society. ***Title tr.:*** Use of aircraft for oceanographic investigations in the Arctic.

The development of methods of aerial investigations in the Arctic since 1914 is outlined, and the efficiency of ice scouting and of aircraft landing on the ice for hydrological studies is noted. Since 1950 over 1 million km. are covered annually in air surveys; fixed routes and air photographs enable analysis of regularities in ice-cover formation and modifications associated with weather changes and other physiographic phenomena. Regular oceanographic investigations since 1948 covering the Arctic Ocean have collected important data on the ice cover, its properties and drift, and heat exchanged by the ice with the atmosphere and water. The use of aircraft, helicopters in particular, makes investigations in hitherto inaccessible areas possible at any season, including completion of drift data with radio beacons.—From SIPRE. ***Copy seen:*** DLC.

52633. LAMB, HUBERT H. Differences in the meteorology of the northern

and southern polar regions. (Meteorological magazine, Dec. 1958. v. 87, no. 1038, p. 364–79, 3 tables, 3 graphs, 5 text maps.) 23 refs. Paper read at International Union of Geodesy and Geophysics, Toronto, Sept. 1957.

Differences in the extent and distribution of land, ocean and ice, and in the heat budget, introduce important differences of general atmospheric circulation between the Arctic and Antarctic. The geographic setting, radiation and heat budget are briefly treated; their effects on weather are discussed. Climatic changes resulting from variations in the general circulation are described.

Copy seen: DLC.

52634. LAMB, HUBERT H. On the frequency of gales in the Arctic and Antarctic. (Geographical journal, Sept. 1957. v. 123, pt. 3, p. 287–97, 4 text charts, 6 tables.) 40 refs.

Contains maps showing distribution of gale frequency in Davis and Denmark Straits, Greenland and Barents Seas, Svalbard waters for periods 1930–1935, 1945–1949; also data on number of days a year with storm for five stations in Greenland and two in Iceland during 1890–1935, 1938–1950; average yearly wind force in Svalbard for five periods between 1912–1953. Since about 1935–1940, gale frequency has decreased in high latitudes and increased over Iceland. Conclusions: broadest regions of high frequency of gales are over open water south of Greenland and Iceland; most intense maxima of gale frequency and strongest gales are at points on or near East and Southeast Greenland coasts; minima along the West Greenland coast. Very low temperatures are observed during gales fed by katabatic drainage of cold air off inland ice. *Appendix* includes table showing number of days with gale (Beaufort force 8) at nine stations in Greenland between 1930–1954 and on a Soviet North Pole drifting station 1954–1955. ***Copy seen:*** DGS.

52636. LANDAUER, JOSEPH K. On the deformation of excavations in the Greenland névé. Wilmette, Ill., Apr. 1957. 14 p. diagrs., tables. (*In:* U.S. Army. Corps of Engineers. Greenland ice cap research program, 1955–56, v. 2. SIPRE research report 30.) 7 refs.

Describes results of deformation measurements made for two years in a tunnel, two trenches, and a pit 30-m. deep, excavated in the summer of 1954 at SIPRE Test Site 2 on the icecap, about 200 mi. east of Thule. Results indicate that closure rates increase with lateral distance from a restraining boundary up to distances of about one meter. At greater distances, the boundary has little effect. Observed results generally agree with theoretical calculations. *Also pub.* in: International Union of Geodesy and Geophysics, Association of Scientific Hydrology, 11th assembly report 1958. v. 4, p. 475–91. ***Copy seen:*** CaMAI.

52637. LANDAUER, JOSEPH K. Some preliminary observations on the plasticity of Greenland glaciers. Wilmette, Ill., July 1957. 6 p. text map,

diagrs., tables. (*In:* U.S. Army. Corps of Engineers. Greenland ice cap research program, 1955–56, v. 2. SIPRE research report 33.) 5 refs.

Discusses measurements obtained from tunnels excavated at Red Rock and TUTO sites near Thule, in the summers of 1954 and 1956. Three topics are considered: the shearing of an initially vertical peg system at Red Rock, the deformation of core holes at TUTO, and tunnel closure at both sites. Experimental data were uncertain; calculated results, possibly of limited reliability, suggest that very large changes in motion are reflected by very small changes in shear stress.

52638. LANDERGREN, STURE. On the geochemistry of Swedish iron ores and associated rocks. Stockholm, 1948. 182 p. 67 tables, 31 diagrs. (Sweden. Geologiska undersökningen, ser. C, no. 496.) 128 refs. *Also pub. as:* Stockholm högskolas mineralogiska institut. Meddelanden, 1953, ny följd., bd. 9, no. 183.

Problems connected with the enrichment of iron and the ore formation are considered. Development of the lithosphere, and the distribution of some major constituents of igneous rocks and iron ores are discussed in relation to problems in Sweden The research materials, methods used, and analytical results are presented. On geochemical premises, the principles governing iron ore formation in the lithosphere are advanced. ***Copy seen:*** DGS.

52639. LANDGREN, SVEN. Cortical reception of cold impulses from the tongue of the cat. (Acta physiologica scandinavica, 1957. v. 40, no. 2–3, p. 202–209, illus.) 3 refs.

Out of 36 cortical cells studied with extracellular microelectrode technique, 12 responded to cooling only, while 24 responded also to other stimuli, mainly mechanical. Four different patterns of "cold-cell" discharge were found; the latency, duration and frequency of these responses depended on the intensity of cooling. Short latency responses were found in the "cold cells" only; long latency reactions in the others.

52640. LANDMARK, BJØRN, *and others.* Ionospheric h'f-observations obtained during the period of the solar eclipse of 30th June 1954. (Norske videnskaps-akademi i Oslo. Geofysiske publikasjoner, 1956. v. 19, no. 8, p. 6–28, tables, diagrs.) 9 refs. *Other authors:* F. Lied *and* S. Skribeland.

Describes and analyzes observations from Kjeller, Tromøya, and Tromsø (69°59′ N. 18°46′ E.). Values of foF2, foF1, and FoE are plotted together with median values from the control period; observed critical frequencies for the E, F_1, and F_2-layers are tabulated. Only the recombination of free electrons is taken into account in interpreting the results; the results cannot be explained in terms of a uniform distribution of the ionizing agency over the sun's disc; a solar model was postulated to give better agreement with observed and calculated curves. With regard to the F_2-layers it was found that at a period around max. eclipse, the observations could only be explained in terms of a marked solar control of the ionizing agency; a small dip some time before the optical eclipse may possibly be explained in terms of a corpuscular eclipse.

Abstracts paper presented at the Society meeting in Atlantic City, Nov. 1–3, 1957. Describes rock formations and fossils associated with occurrences of amber derived from Cretaceous conifers between 69°40′ N. and 70°05′ N. along the Kaolak River and lower Ketik River above Wainwright. ***Copy seen:*** DGS.

52647. LANGSAETER, ALF. Noen tiltak for å intensivere skogsbruket i Norge. (Svenska skogsvårdsföreningen. Tidskrift, 1956. årg. 54, nr. 1, p. 1–9.) Text in Norwegian. ***Title tr.:*** Some efforts to intensify forestry in Norway.

Effective forest policy in Norway began with the national forest law of 1932. With some changes, this law has served to raise both production and forestry standards. Systematic levies on standing and marked timber provide funds used for supervision, education, and for both reforestation and afforestation programs. The latter is important in the west and north coastal areas. Millions of trees are produced in nursery and set out each year. State support for improvement of management and forests reaches to 75% in northern Norway. Although costs are high, it is generally agreed that the forestry program is economically sound and beneficial to the country. ***Copy seen:*** DA.

52648. LANTERNARI, VITTORIO. Gli eschimesi della Terra di Baffin. (Vie del mondo, Apr. 1958. anno 20, no. 4, p. 403–412 illus., map.) Text in Italian. ***Title tr.:*** The Eskimos of Baffin Land.

Sketches the geographic features of Baffin Island and describes the present-day life of its Eskimo population: seal, bear and caribou hunting, winter and summer housing (igloos, tents), contacts and trade with whites, etc. Though some features of original customs and traditions persist in their mode of life, religious rituals and moral code, the process of acculturation is strongly felt both in its positive (missionary work, schools, health services) and negative results (weakening of the authority of community elders, spread of tuberculosis).

52649. LANTIS, MARGARET L., 1906– . American arctic populations: their survival problems. (Biology Colloquium, 18th, 1957. p. 119–130, illus., tables.) 33 refs.

Cultural adaptation study of Eskimos in Canada, Greenland and Alaska. Pop-

ulation (increasing) data are given; physical and cultural characteristics are briefly described. Prehistoric ecological changes as revealed by archaeologists, and Eskimo methods of survival in the arctic environment are presented as background against which current problems are viewed. These people adjusted to a difficult physical environment and survived several fundamental changes in the past; they are now faced with the problem of adjusting to a new social environment brought in by white men, and of changing from a subsistence to a money economy. Efforts of U.S., Canadian and Danish governments to aid adjustment are reviewed and factors hindering acculturation are examined. The importance of preserving the self-assurance of the Eskimos is stressed.

Text in Russian. ***Title tr.:*** Changes of rock porosity and gas permeability at sub-zero temperatures.

Outlines the behavior of gas, water and rocks below 0° C. Investigations were made at positive and negative temperatures of the porosity and impermeability of partly and completely saturated sandstones. Results are presented of a series of tests at sub-freezing temperatures on the permeability in dried and wetted sandstones, also in those ("water-bearing") with natural moisture. In the dry rocks, gas permeability rises with dropping temperature and reaches a maximum at −2° to −5° C. In the wet rocks, gas permeability decreases with diminishing temperature. In the "water-bearing" rocks, however, no substantial changes are noted. Testing instruments are described and results are diagrammed.

Text in Russian. ***Title tr.:*** Main results from work of investigating the development of bottom sediments in the Arctic Ocean.

Reports that this kind of investigation initiated in 1956 has been carried on through 1958 by the high latitude expeditions, the expeditionary vessels, *Ob', F. Litke, Lena, Gorizont, Mogilev,* and by drifting stations. Some 400 bottom sediment samples have been collected from the central Basin, 60 from northern Greenland Sea, and about 300 in the Kara Sea and Franz Joseph Land straits. Arctic Basin bottom sediments are distinguished in three mineralogic provinces: epidote-amphibole, ore-epidote pyroxene, and chloritic. Each province is briefly characterized; vertical stratification and variation of bottom sediments are outlined. Differences in the Greenland Sea sediments are noted. The Arctic Ocean's connection with the Atlantic, it is concluded, is limited not by the Nansen Rise but by the Wyville Thomson Ridge.

Analyzes the drifts of the *Sv. Anna* 1912, *Chelii͡uskin* 1933, *Severnyĭ Polii͡us-1* 1937–38, *Sedov* 1938–39, and T-3 in 1952 to determine the cause and general trend of rotation at various locations. Large ice fields in the Arctic Basin as a rule maintain a fixed orientation during their drift. The same tendency is observed also in the shelf seas, and it contributes to the development and maintenance of extensive ice fields in the winter season. Rotation of drifting fields is initiated by the influence of unequal currents and winds, change in direction of drift, by collision and friction with shores and with ice fields of a different drifting speed.

Laboratory equipment and investigation procedure are described in detail.

36 samples of pit run gravel of fines content ranging 0.0–10% were examined; each group of 6.0 and 10.0% fines content included one sample each of 0.0–4% calcium chloride. Properties and characteristics of the gravel are described. Tabulated results show that the average heaving is 40% with 4.0–2.0% fines content, and 25% with 2.0%–0.0% fines content. Calcium chloride in a low concentration reduced the frost-heaving considerably in well-graded gravel, besides increasing the density and lowering permeability. ***Copy seen:*** DLC.

A translation of Andreas Abrahamus Indrenius' *Specimen academicum de Esquimaux, gente Americana,* Aboae, 1756 (copy in DLC), a dissertation in Latin based in part on information collected by the Swedish naturalist, Pehr Kalm (1716–1779), and printed in vol. 3, p. 446–51, of his *En resa til Norra America,* Stockholm, 1753–1761 (copy in DLC). The dissertation reflects the ideas (part fact, part fiction) prevalent in the 18th century and deals with the customs, etc. of the Labrador Eskimos. A list of approx. 100 Eskimo words is appended. A short introduction by the editor describes P. Kalm's visit to North America. ***Copy seen:*** DLC.

52663. LARSEN, HELGE EYVIN, 1905– . The material culture of the Nunamiut and its relation to other forms of Eskimo culture in northern Alaska. (International Congress of Americanists, 32nd. *Copenhagen,* 1956. Proceedings, 1958. p. 574–82, illus.) Refs. in text.

Based on author's 1950 investigations and the studies of R. Rausch (No. 25394) and H. Ingstad (No. 22821). This small Eskimo group living in the Brooks Range, known under the collective name of Nunamiut (i.e., people of the land) comprises several inland units. Their material culture, yearly migration cycles, economy, etc., are described and compared with other Alaskan Eskimo groups. The Nunamiut are semi-nomads with an inland-coast culture based on caribou hunting and sealing, a pattern predominant in northern Alaska except for large coastal villages. This inland-coast culture is considered older than the true inland culture. The fishing and hunting gear of the Ipiutak and Denbigh Flint Complex people are examined and their attribution to an inland-coast culture suggested. ***Copy seen:*** DSI.

52664. LARSEN, HELGE EYVIN, 1905– , *and* **J. MELDGAARD.** Paleo-Eskimo cultures in Disko Bugt, West Greenland. København, C. A. Reitzels Forlag, 1958. 75 p., illus., 5 plates, diagr.,

tables, maps. (Meddelelser om Grønland, bd. 161, nr. 2.) 53 refs.

Report on the archeological finds made in the summer of 1953 by the Danish National Museum party on Disko Bay. The first chapter (p. 9–32) dealing with the excavations at Sermermiut, near Jakobshavn, is written by J. Meldgaard, the preface (p. 5–7) and second chapter (p. 32–71) on the motorboat survey of all known and likely Paleo-Eskimo sites of Disko Bay are by H. Larsen. Two main pre-Thule cultures, Sarqaq and Dorset, were established, radiocarbon dated and related to periods of comparatively warm continental climate. At Sermermiut, sterile layers separate the Sarqaq, Dorset and Thule stages indicating definite time-limited periods of occupation. The artifacts are described in turn and tabulated, the Sarqaq grinding technique compared to the middle layer of Cape Denbigh, and the latter's lower C–14 dating (2016 ± 250 years old) favored for the Sarqaq finds. The construction of Sarqaq dwellings is speculated upon from three rather disturbed remains, two at Igdluluarssuk and one at Tuperssuit, and tentring structures covered by skins suggested. A sequence of at least five independent immigrations to Greenland proposed: Independence I, Sarqaq, Independence II and West Greenland Dorset, "classical" Dorset, Thule.

52665. LARSEN, JOHN. Weather information as an air navigation aid on the polar route. (Navigation, summer 1958. v. 6, no. 2, p. 86–88.)

Points out the requirements for lightweight navigational equipment in commercial aircraft, the high-density passenger load precluding use of heavy (though highly perfected) military equipment. The less elaborate gyro compasses and radars increase the navigator's dependence on interpretation of meteorological data. Navigational problems on Trans World Airlines' route Los Angeles-Paris, due to inadequate weather charts and forecasts, are outlined. It is suggested to change from the Standard Lambert conformal projection charts to curved plastic charts in Mercator projection, with identification data glued to the under side of the transparent sphere section. Without distortion in scale and meridian convergence, this chart would give a true perspective and eliminate the correction factors. ***Copy seen:*** DLC.

52676. LAUGHLIN, WILLIAM SCEVA, 1919– . Blood groups of the Anaqtuavik Eskimos, Alaska. (International Congress of Americanists, 32nd. Copenhagen, 1956. Proceedings, 1958, p. 594.)

Abstract of a paper on the results of a blood-typing test sponsored by the Arctic Aeromedical Laboratory, Ladd Air Base and conducted in Dec. 1955 among a group of these Eskimos in the Brooks Range. Forty-three members of the 72-person isolate were typed for the presence of antigens of the ABO, MN and Rh systems. Phenotype distribution showed a higher than expected frequency of A_1 and of B, a fact attributed to a selective migration of coastal Eskimos and not to a genetic drift. No evidence of Indian or European admixture was found (No. 46264). ***Copy seen:*** DSI.

52677. LAUGHLIN, WILLIAM SCEVA, 1919– . Neo-Aleut and Paleo-Aleut prehistory. (International Congress of Americanists, 32nd. Copenhagen, 1956. Proceedings, 1958. p. 516–30, diagrs., tables.) 19 refs.

Compares the skeletal records and associated artifacts to determine the factors of foreign immigration versus local evolution in cultural changes, taking as test case the finds from Chaluka, Umnak Island. The differences in workmanship and type of stone artifacts (weights, projectile points, knives, etc.) found at different excavation levels suggest a change in population stock. A change from dolichocephaly to brachycephaly is noted corresponding to the general trend toward brachycephaly among Aleuts and Eskimos. An immigration from the west about 4,000 years ago (figure based on radio-carbon dating) is considered likely for the original occupancy of the island by dolichocephalic Paleo-Aleuts or proto-Aleut-Eskimos and a later (unspecified) arrival of a brachycephalic Neo-Aleut variant from the east is suggested. Comparisons are drawn between the cultural and anthropological developments of the Aleuts and Greenlandic Eskimos. The Chaluka excavations provide a minimum date of 2000 B.C. for the evolution of boats and establishment of sea-mammal hunting among Eskimos, as the settlement of the island presupposes the existence of a marine economy. ***Copy seen:*** DSI.

Vestnik, 1957. god 12, no. 14, p. 20–33.) 32 refs. Text in Russian. Summary in English. ***Title tr.:*** The importance of Lenin's Cooperative Plan for realization of the non-capitalistic development of the small northern peoples toward socialism.

The Cooperative Plan, drafted by Lenin in 1923 as an instrument of socialization and collectivization of the Russian farm economy is summarized; pre-Revolutionary living conditions of northern peoples are characterized and the results of the Soviet system of "integral" (many-sided) cooperation in the North are praised. Mistakes of local party authorities who pressed too hard and too fast to bring the primitive economy of small peoples into the frame of a collective economy are noted (p. 27) as well as the decisions of the central authorities against these errors. The "Simplest Production Associations" (Prosteĭshie proizvodstvennye ob"edineniîa, PPO) for gradual transition from an individual to a collective economy in the North are described (p. 28–32) and data are given to demonstrate success of collectivization in several national districts.

52691. LAVROV, V. V. Ėlektroprovodnost' l'da. (Problemy Arktiki, 1958. vyp. 3, p. 79–82, table, graphs, diagr.) 2 refs. Text in Russian. ***Title tr.:*** Electrical conductivity of ice.

Current measured in circuits containing samples of tapwater ice 1.5–1.7 cm. thick at temperatures from 0° to −25° C. ranged from 0.018 to 2.35 ma.

for impressed voltages of 3.8–376 v. A uniform attenuation, which leveled off at 2% of the initial current at three hrs., was caused by the formation of space charges near the electrodes. Repeated testing after 15–16 hr. rest produced only 50% of the initial current in the first tests and the attenuation rate was higher. A delayed (5–10 min.) increase in conductivity of about 25–30% was observed under the influence of light from a standard electric bulb (150 watt). The logarithmic relation between specific conductivity and temperature was linear, varying from 0.6×10^7 ohm/cm. at 0° C. to 21×10^7 at −25° C. Inclusions of 0.05% NaCl resulted in a 100-fold or greater increase in conductivity.—From SIPRE. ***Copy seen:*** DLC.

52692. LAVROV, V. V. Ĭavlenie obrazovaniĭa vnutrivodnogo l'da kak profsess umnozheniĭa kristallicheskikh zarodysheĭ. (Problemy Arktiki, sbornik stateĭ, 1957. vyp. 1, p. 91–97.) 14 refs. Text in Russian. ***Title tr.:*** Formation of submarine ice by growth of crystal nuclei.

Ice-crystal formation and growth in supercooled water is discussed: crystals received from the atmosphere and river banks and the formation of bank ice are responsible for the crystallization of supercooled water rather than spontaneous crystal formation. Slight supercooling (less than 0.2° C.) favors melting of crystal facets to create ice discs; a chain reaction occurs after the appearance of the first crystals.—From SIPRE.

Copy seen: DLC.

52693. LAVROV, V. V. K voprosu obrazovaniĭa vnutrivodnogo l'da. (Meteorologiĭa i gidrologiĭa, May 1957, no. 5, p. 43–45.) Text in Russian. ***Title tr.:*** The formation of underwater ice.

The methods suggested by Piotrovich for controlling underwater ice are discussed on the basis of experimental data characterizing the formation of ice crystals in water supercooled to −0.2° C. The appearance of an ice crystal in supercooled water causes the formation of numerous crystals around it, and such formation is not associated with disintegration of an initially formed crystal. Maximum possible force of ice-crystal impact on obstacles cannot exceed 144 gm./sq. cm., i.e., much less than ice strength near the melting point. Artificially increasing the number of crystallization nuclei as recommended by Piotrovich cannot be considered as an effective countermeasure because the intensity of underwater-ice formation depends on heat losses in the stream, not on crystal number.—From SIPRE.

52694. LAVROV, V. V. Modelirovanie l'da. (Problemy Arktiki, sbornik stateĭ, 1957. vyp. 2, p. 185–91, illus.) 2 refs. Text in Russian. ***Title tr.:*** Ice models.

"The preparation of models similar in structure and strength to natural ice is discussed, and techniques used in the laboratory of the Arctic Institute are described in detail, including methods for reducing crystal dimensions and sample strength to scale. Snow crystals not larger than 0.8 mm. in diam. evenly distributed on the surface of supercooled water (100–110 gm. of snow/sq. m.) produced homogenous ice samples. Similar effects were obtained instantaneously with moving air at −30° to −35° C. NaCl was added to decrease sample strength. Manipulation of water salinity, the number of freezing nuclei, and temperature permitted production of ice with bending strengths ranging from several tenths kg. to 20 kg./sq. cm."—SIPRE. ***Copy seen:*** DLC.

52696. LAW, PHILLIP. Australian National Antarctic Research Expedition buildings in Antarctica. (Polar record, Jan. 1957. v. 8, no. 55, p. 329–32, 4 illus.)

The "Mark I" hut, erected in 1950 utilized "Onazote" insulating material panels assembled by bolting to the frame so as to compress separating strips of rubber. The "Mark II", 1952 dispensed with the frame of the "Mark I" and had panels bolted together with brackets. The "Mark III" was modified to include clamping rods tightened with bolts at the ends, perspex "box" windows filled with dried air and sealed, entry hatches in the roof, uninsulated "cold porch", cheerful color scheme and well designed furnishings, exhaust fan ventilation and cokestove heating, aluminum sheathing of outer surfaces. The "Mark IV" hut built in 1955 stressed economy of space and individual comfort of the men; 27 ft. long, 15 ft. wide externally and 9 ft. high internally, it has a flat roof. A description of the hut is given. Erection time of most huts was usually one day.

52697. LAWRENCE, DONALD BUERMANN, 1911– . Glaciers and vegetation in southeastern Alaska. (American scientist, June 1958. v. 46, no. 2, p. 89–122, illus., diagrs., maps, graph.) 69 refs.

Considers glacier behavior on the basis of recent studies of glaciers, botanical evidence, sedimentary deposits, and sea levels. Glaciers studied in the United States, southwest Norway, and in Southeast Alaska at the Juneau Ice Field and Glacier Bay, showed a maximum advance in the 17th and 18th centuries. This "little ice age" studied in detail may elucidate why glaciation occurs. A period of low sunspot activity coinciding with this period of advance suggests decreased solar energy as a factor in glacier growth. Other hypotheses are mentioned. Vegetation development following ice recession is analyzed, and detailed observations made at Glacier Bay are described.

52698. LAWRENCE, WILLIAM E. Some ecotypic relations of *Deschampsia caespitosa*. (American journal of botany, June 1945. v. 32, no. 6, p. 298–314, 11 illus.) 26 refs.

Study of 21 individuals representing eight races of *D. caespitosa*, a grass which came from Lapland, Finland, southern Sweden and North America. All races are cytologically uniform, having 2n=26 chromosomes. Five ecotypes are recognized, including a subarctic ecotype from Lapland; all five belong taxonomically to one subspecies, *D.c.* ssp. *genuina*. Three subspecies are recognized in western North America: *genuina*, occurring from central Alaska and Yukon southward to California; *beringensis*, strictly coastal from Kamchatka, the Commander and Pribilof Islands, along Aleutian chain to California and *holciformis* from Oregon to California. All these ecotypes came from climatically different areas and they may be referred to as climatic ecotypes.

52699. LAWS, R. M. Polarity of whale ovaries. (Nature, *London*, May 18, 1957. v. 179, no. 4568, p. 1011–12, illus.) 7 refs.

Report based on an investigation of several hundred specimens each of fin whales (*Balaenoptera physalus*) and blue whales (*B. musculus*). The corpora albicantia were found grouped towards the anterior pole of the ovary. This condition is more patent in the fin whale; it implies that ovulation generally takes place from the anterior part of the ovary. Similar conditions exist in the mare, which supports the idea of a common origin of whales and ungulates.

52709. LEBEDEV, ALEKSEĬ PETROVICH. The Tunguska paleovolcanic formation. (*In:* International Union of Geodesy and Geophysics. Association of Volcanology. Bulletin volcanologique, *pub.* Naples, 1958. série 2, t. 19, p. 135–41. Eleventh General Assembly, Toronto, 1957.)

Describes briefly and in general, Upper Paleozoic-Lower Mesozoic, volcanic formations of the so-called Tungusska basin in the western part of the Siberian platform. Widespread volcanic activity occurred during the Upper Permian-Lower Triassic period over much of the basin; a second great phase of volcanic activity, the Triassic, was less widespread. Volcanism in this region and period was prolonged, and manifested itself in such different forms as explosions, fissure eruptions, and subvolcanic sill intrusions. Pyroclastic rocks of varied composition, size and shape were erupted; predominantly basaltic eruptions, resembling those of Hawaiian volcanoes, also took place. The close relationship is stressed between the type of volcanism, the composition of the corresponding rocks and the type of tectonic movements in the corresponding period. ***Copy seen:*** DGS.

52721. Le BLANC, JACQUES ARTHUR, 1921– , *and* F. J. ROSENBERG. Local and systemic adaptation to topical cold exposure. (Journal of applied physiology, Nov. 1957. v. 11, no. 3, p. 344–48, illus., table.) 14 refs.

Repeated exposure of the hand to a cold bath (3° C.) produced a gradual disappearance of blood pressure drop observed after the bath. Additional experiments suggest this to be due to a systemic change, and the fall in blood pressure due to a histamine-like substance liberated by the cooled hand.

Copy seen: DNLM.

52722. Le BLANC, JACQUES ARTHUR, 1921– , *and* F. J. ROSENBERG. Mast cell changes in animals exposed to cold. (Society for Experimental Biology and Medicine. Proceedings, Oct. 1957. v. 96, no. 1, p. 234–37, illus., table.) 11 refs.

Report on investigation on the number of mast cells in the skin (ear, abdomen) and in the peri- and intervascular mesentery of rats exposed to 2° or 6° C. for two or four weeks. The increase in the number of cells in the abdominal skin and the changes in the mesentery are considered to be systemic effects of cold; the decrease in the ear, local effects.

Copy seen: DNLM

52723. Le BLANC, JACQUES ARTHUR, 1921– . Prefeeding of high fat diet and resistance of rats to intense cold. (Canadian journal of biochemistry and physiology, Jan. 1957. v. 35, no. 1, p. 25–30, tables.) 12 refs.

Animals fed a diet containing 17% lard or oil, showed a slower and less pronounced drop in body temperature when exposed to cold, than normally fed controls. This higher resistance to cold is claimed to be not due to fat reserves serving as source of energy or as an insulator but to fat-induced changes in the organism permitting higher rates of heat production. ***Copy seen:*** DNLM.

52724. Le BLANC, JACQUES ARTHUR, 1921– . Role of adrenaline and noradrenaline on response of cold-acclimatized animals to chlorpromazine. (Society for Experimental Biology and Medicine. Proceedings, June 1958. v. 98, no. 2, p. 406–407, illus.) 12 refs.

Report on experiments with rats acclimatized for four weeks to cold of 40° F. Acclimatization was found to have an antagonistic effect on CPZ hypothermia and to increase sensitization of tissues to adrenaline and noradrenaline. The latter two substances potentiate the antagonism of acclimatization towards CPZ. Dibenamine abolished this antagonism. ***Copy seen:*** DLC.

52725. Le BLANC, ROBERT G. Scientific activities of the Terrestrial Sciences Laboratory of the Geophysics Research Directorate on Fletcher's Ice Island, T–3. June 6, 1957 to September 25, 1957. (*In:* American Geographical Society. Preliminary reports of the Antarctic and Northern Hemisphere glaciology programs, 1958. p. XIV, 1–3, 2 text maps, 2 diagrs.)

Describes progress of the geophysical program, part of the U.S. National Committee-IGY Project Ice Skate, as carried on by three investigators. Tentative values for location of T–3 are listed; apparent clockwise rotation of 17° was recorded; gravity meter readings were made daily; bathymetric measurements were made; ice temperatures were observed to depths of 30 and 92 ft.; ablation measurements during the thaw period showed a loss of the snow cover and 20 in. of island ice. Surface weather observations were made every six hrs., and upper wind determinations when possible; snow temperature and density were

measured until the snow melted. Several other features were studied, including rock specimens and fauna.

"The existence of an arctic stratospheric jet stream in winter, hitherto largely inferred from mean geostrophic wind sections, is considered on the basis of actual winds for the Canadian arctic

area during the winter of 1955–1956. Temperatures at the 100-millibar level at a number of stations over the Canadian Arctic were examined to throw light on the intensely baroclinic zone below the jet stream. Meridional movements and intensity changes of the jet stream during this winter, as inferred from a statistical study of the 100-mb. temperature field, are in accord with the conventional view that the jet stream is maintained by differential radiational heating and cooling of the ozone layer across the boundary of polar night."—Authors' abstract.

52749. LENINGRAD. NAUCHNO-ISSLEDOVATEL'SKIĬ INSTITUT GEOLOGII ARKTIKI. Geologiîâ Sovetskoĭ Arktiki. Pod obshcheĭ red. F. G. Markova i D. V. Nalivkina. Moskva, Gosgeoltekhizdat, 1957. 520 p. col. map in 4 sheets. (*Its:* Trudy, t. 81.) Text in Russian. ***Title tr.:*** Geology of the Soviet Arctic. F. G. Markov and D. V. Nalivkin, editors.

Major work, summarizing results of geological investigations over the last 40 years, chiefly by the Institute of Geology of the Arctic, and, prior to 1953, by the Main Administration of the Northern Sea Route. The area reported is not all northern U.S.S.R., but a broad zone from the Polar Ural in the west to the Verkhoyansk region in the east, and north of the Arctic Circle, including islands of the shelf seas. The principal aim is to give unified systematic and coordinated presentation of the geological knowledge of the area. The 15 regional chapters have a common plan: an outline of setting of the region; a statement of its geological investigation to date naming the principal scientists, general characteristics of the relief, stratigraphy of the existing systems, formations and series, volcanic activities and tectonics; finally a short survey of the geological indications of useful mineral resources. No illustrations are included, no sources, published or other, are cited. The volume is accompanied by a four-sheet geological map at scale 1:2,500,000, in color; its scientific editor is D. V. Nalivkin. The chapters, as listed below with titles translated, are described in the Bibliography under their authors' names, viz:

DIBNER, V. D. Geological structure of Franz Joseph Land.

DIBNER, V. D. Geological structure of Viktoriya Island.

DEMOKIDOV, K. K., *and others.* Geological structure of Novaya Zemlya and Vaygach Island.

IVANOVA, A. M., *and others.* Geological structure of the Polar Ural and Pay-Khoy.

DIBNER, V. D. Geological structure of the islands of the central part of the Kara Sea.

SOKOLOV, V. N. Geological structure of the northern part of the west Siberian lowland.

TKACHENKO, B. V., *and others.* Geological structure of the northern part of the central Siberian plateau.

SAKS, V. N., *and* I. S. EGOROVA. Geological structure of the western part of the north Siberian lowland, Taymyr lowland.

SÎAGAEV, N. A. Geological structure of the eastern part of the north Siberian lowland, Lena-Anabar interfluve.

MARKOV, F. G., *and others.* Geological structure of the Taymyr Peninsula.

EGIAZAROV, B. Kh. Geological description of the Severnaya Zemlya archipelago.

ATLASOV, I. P. Geological structure of the northern part of the Verkhoyansk Range.

LAZURKIN, V. M. Geological structure of the lower reaches of the Lena River, Lena depression.

LOBANOV, M. F. Geological structure of the New Siberian Islands.

LOBANOV, M. F. Geological structure of Vrangelya and Geral'da Islands.

Presents obituary of this noted geologist, who died Oct. 2, 1958 in Guli while leader of the Maymecha expedition organized by the Institute. Born June 25, 1907 in Dzhubga village, Krasnoyarsk province,

he was graduated by Leningrad State University in 1930; and he devoted his entire life to exploration of arctic regions. His main work was on Noril'sk copper and nickel ores. He also studied the Nizhnyaya Tunguska region, Anabar crystalline shield, Dikson Island, the Kotuy-Maymecha region and other parts of the Siberian platform. He took an active part in preparing the geological map of Soviet Arctic at scale 1:2,500,000. His 68 published works (listed) concern geology, mineralogy and mineral resources. ***Copy seen:*** DGS.

52751. LENINGRAD. NAUCHNO-ISSLEDOVATEL'SKIĬ INSTITUT GEOLOGII ARKTIKI. Nefte-gazonosnost' severa Sibiri. Pod. red. I. S. Gramberga i M. K. Kalinko. Leningrad, Gostoptekhizdat, 1958. 217 p. tables, diagrs. incl. 1 fold, maps. (*Its:* Trudy, t. 92.) Refs. Text in Russian. ***Title tr.:*** Oil and gas prospects in northern Siberia. I. S. Gramberg and M. K. Kalinko, editors.

Contains 12 papers delivered at the special session of the Scientific Assembly of the Institute of Geology of the Arctic, held Apr. 25–30, 1957, where geologic work and oil and gas prospecting to date in the area from the Ural east to the Verkhoyansk Mts. were evaluated, summarized, and further plans discussed. The papers deal with three major problems: *1*, the stratigraphy of Sinian, Cambrian, Devonian, Permian, Jurassic and Cretaceous deposits in which oil and gas occurrences are indicated; *2*, tectonics and tectonic structures suitable for oil exploration; *3*, reports on geologic, gravity, and seismic surveys and drillings and their results on the presence or absence of oil and gas accumulations. Appended (p. 215–16) are the Assembly's resolutions to continue and speed prospecting in order to supply the Yenisey region industries with oil, and to expand Yakutia diamond production; to lay down general plans for further geologic and geophysical explorations; and to establish special organization for carrying out these tasks. The papers as listed below (title tr.) appear in this Bibliography under their authors' names, viz:

MARKOV, F. G. Stratigraphy of the Lower and Middle Paleozoic deposits in the central zone of the Soviet Arctic.

USTRITSKIĬ, V. I. New data on the stratigraphy of the Upper Paleozoic in the central zone of the Soviet Arctic.

SOROKOV, D. S. Stratigraphy of the Triassic deposits in the central zone of the Soviet Arctic.

Development of the kimberlite pipes is discussed, with conclusion that their age is post-Lower Triassic and pre-Jurassic; it coincides with final stages of trap magmatic formations. The volume of the kimberlite mass in pipes is insignificant in comparison with that of

trap formations; and the content variable, consisting of basalt, limburgite, aluminum oxide, titanium and picrite. Chemical analyses of kimberlite and its derivatives are tabulated. The depth of the pipes' explosive chambers is comparatively small (1–4 km.), and apparently the breccia was formed under a very strong pressure. A hypothetical scheme of the pipes' development, connected with the flexure of enclosing rock formations and initiated by the explosion of earth crust gases, is figured. ***Copy seen:*** DLC.

52758. LEONT'EVA, O. O pesnîâkh i lîûdîâkh Sibirskogo khora. (Sovetskaîâ muzyka, Sept. 1957. god 21, no. 9, p. 26–32, illus.) Text in Russian. ***Title tr.:*** The songs and members of the Siberian Chorus.

The repertoire, mostly folkloristic, includes folk songs of northernmost Siberia such as the reindeer dance and song "Kheĭro;" examples of music and words are given. Organized in 1945 as an all-women ensemble, the chorus added male singers, also a dance group in 1951. It has been headed since 1954 by V. Levashov, a noted composer and participant in numerous folkloristic expeditions. ***Copy seen:*** DLC.

52759. LEOPOLD, ALDO CARL, 1919– , *and* F. S. GUERNSEY. Flower initiation in Alaska pea, I; evidence as to the role of auxin. (American journal of botany, Jan. 1953. v. 40, no. 1, p. 46–50, 5 diagrs., table.) 22 refs. *Pub. also as:* Journal paper no. 619, Purdue Univ., Agricultural Experimental Station.

Reports results of studies using 4-hr. soak treatment of *Pisum sativum* var. *alaska* seedlings. The node of first flower, it was found, can be altered experimentally. Auxin (naphthaleneacetic acid) at 18°–20° C. quantitatively inhibits flowering in the pea. The flowering is strongly modified by the temperature experienced in the first few days after germination; the optimum for early flowering is 18°–22° C. Application of auxin, which inhibits flowering at higher temperature, actually promotes it if followed by a brief exposure to 10° C. Several common metabolites, such as sucrose, malic acid, and arginine, were found to inhibit flowering; this can be reversed by the addition of auxin. ***Copy seen:*** DLC.

52760. LEOPOLD, ALDO CARL, 1919– , *and* F. S. GUERNSEY. Flower initiation in the Alaska pea, II; chemical vernalization. (American journal of botany, Mar. 1954. v. 41, no. 3, p. 181–85, 5 diagr.) 14 refs. *Pub also as:* Journal paper no. 733, Purdue University, Agricultural Experimental Station, Lafayette, Indiana.

Contains an analysis of chemical vernalization, i.e., the promotion of flowering in the Alaska pea with auxin treatment of seeds followed by low temperature. Several materials, including auxins and auxin synergists, were found effective. Varied day lengths applied after vernalization did not alter the response, but high light intensities (800 ft.-c.) can greatly reduce the promotive effects. Chemical vernalization effects were nullified by heat (39° C. for 18–24 hrs.), by nitrogen atmosphere (for 48–96 hrs.) or by CO_2-free air (for 12 hrs.) applied after the cold treatment. Chemical vernalization, it is suggested, should take place in two steps, the first requiring auxin and low temperature, and the second requiring CO_2.

Transportation costs, direct and indirect, at present and for the next 25 years, are discussed and statistically analyzed. Air, highway, pipeline, rail and water transport are treated in turn, and on a country-wide basis. In the consideration of future technological developments and new facilities and services (p. 109–133), special assessment is made of costs and potentials in the North. Possible highway and railway routes are named; improvement in transportation down the Mackenzie River to Aklavik is recommended, and a recently co-ordinated water-rail service between Vancouver and the Yukon described. Motor truck registration in the Yukon and Northwest Territories was approx. 2,000 in 1954.

Chlorpromazine and reserpine reduce locomotor activity and prolong pentobarbital anesthesia in mice. At an environmental temperature of 32° C. the two drugs were found to be neither sedative nor hypothermizing. The sedative effect was further found to be dependent on the temperature reducing activity of these preparations.

52781. LEVIN, DANIIL MOISEEVICH, *and* **P. F. OGLOBLIN.** Zimnîaîa ėkspluatatsiîa avtomobileĭ. Izd. 2. Moskva, Nauchno-tekhn. izd-vo avtotransp. lit-ry, 1956. 116 p. illus., diagrs., tables. (Biblioteka shofera.) 14 refs. Text in Russian. ***Title tr.:*** Winter operation of motor vehicles. 2d ed. Similar to the first edition (1951, 117 p.) with minor changes in text.

Basic regulation of the main engine and its mechanisms is described in detail, including starting and servicing under winter conditions. Preliminary inspection of all parts and substitution of winter fuel, oil, grease, cooling liquid, also insulation of the starting battery, radiator and driver's compartment are outlined with reference to expected weather severity. Gasolines of grades A–66 and 70 (of 54–58 octane number) can be used with and without the ethyl ingredient, and they can be replaced by mixtures of single or double concentration of gasoline with benzol or alcohol or both, but gasoline A–74 is used straight only. Diesel fuel of 40 cetane, DA, is used for arctic conditions (below −30° C.), fuel DZ for winter (0° to −30° C.) and fuel

of 45 cetane, DL, for summer. Freezing temperatures of these fuels are given as DA: −60° C., DZ: −45° C. and DL: −10° C. Lubricating oil of various grades, and greases are tabulated (p. 49, 53). The brake fluid contains: castor oil with buthyl alcohol, or glycerine with isoamyl alcohol, suitable for temperatures above −55° C. Anti-freeze "40" contains 53% ethylene glycol +47% water (freezing temperature −40° C.); anti-freeze "65" contains 66% ethylene glycol plus 34% water (freezing temperature −65° C.); an anti-corrosive is added to both mixtures. Various methods of cold engine starting are described: steam or hot water circulation; the use of movable water- and oil-heaters (boilers); charcoal preheater under the engine; special blow-torch arrangement or electric heater for water with outside current supply; auxiliary hand pump injection of high volatile fuel during cranking; portable gas generator connected to the carburetor inlet; cranking of the engine with separate electro-motor starting arrangement (p. 97) on platform with wheels. Diesel engine starting can be done either with auxiliary spark plugs in the cylinders, or a glow plug in the air suction line.

52783. LEVIN, MAKSIM GRIGOR'EVICH, 1904– . Anthropological types of the north-eastern Paleoasiatics and problems of their ethnogenesis. (International Congress of Americanists, 32nd. *Copenhagen*, 1956. Proceedings, 1958, p. 607–616.) 9 refs.

Reviews current anthropological theories and analyzes the physical characteristics of present-day Asiatic Eskimos, Coast and Reindeer Chukchis, Coast and Reindeer Koryaks, and Itel'mens (Kamchadals). Despite some Baykal-type admixture among the north Kamchatka tribes, their physical similarity to the Bering Sea (Eskimo) type is cited against the "Eskimo wedge" theory. Writer supports A. M. Zolotarev in criticism of the "Eskimo wedge" and in favoring Asiatic origin of Eskimos, but not an Eskimo-origin of the Chukchis and Koryaks. The area of primary formation of the northeastern Paleoasiatics is placed along the northern Okhotsk coast region of Kamchatka and the cultural dissimilarities between the Okhotsk and Bering Sea cultures are demonstrated in regard to the toggle-harpoon, pottery ornamentation, tool types. The continental culture of tundra and forest tundra hunters and fishers recently discovered on the Yakitikiveyem River, central Chukotka, and dated into the late second-early first millennium B.C., is probably of Yukaghir (A. P. Okladnikov's opinion) rather than Chukchi (I. S. Vdovin's) origin. Baykal-type characteristics among the Reindeer Chukchis and Koryaks are explained by intermarriage with Yukaghirs who occupied interior Chukotka until the 17th century; linguistic data support this theory. The reindeer breeding of the Reindeer Chukchis (Chauchu) and Reindeer Koryaks (Chauchuvan) is traced to the Chavan (or Chuvan) Yukaghirs (Chuvantsy). Kamchadals and Koryaks have an anthropological similarity and probably a common area of origin, rather than two areas (according to S. I. Rudenko) in northern Kamchatka.

Discusses and tabulates the physical anthropological data on the Gilyaks, Golds, Oroki, Negidals, Ul'chi and Ainu collected by the Amur-Sakhalin anthropological-ethnographic expedition in 1947. The three main types: Ainu, Gilyak and Orok-Negidal (Tungus) are described, the last considered a variant of the

Baykal or Paleo-Siberian group. Levin's results are presented in English by C. S. Chard, q.v. ***Copy seen:*** DLC.

52785. LEVIN, MAKSIM GRIGOR'EVICH, 1904– . Ėtnicheskai͡a antropologii͡a i problemy ėtnogeneza narodov Dal'nego Vostoka; trudy Severovostochnoĭ ėkspedit͡sii II. Moskva, Izd-vo Akademii nauk SSSR, 1958. 359 p. illus., diagrs., graphs, tables, maps. (Akademii͡a nauk SSSR. Institut ėtnografii. Trudy, nov. ser., t. 36.) Approx. 530 refs. Text in Russian. *See also* No. 31080, 31084 on this expedition. Pt. I of the investigation: No. 21378. ***Title tr.:*** Ethnic anthropology and ethnogenetic problems of the peoples of the far East; investigations of the Northeastern Expedition, pt. 2.

An exhaustive study discussing and summarizing 19th and 20th century anthropological, ethnographic, etc. literature (almost half of the cited publications are in English, German or French), using also the results of author's own fieldwork and unpublished materials of Soviet scientists. A general review of Russian and non-Russian anthropological classification theories is followed by a detailed ethnogenetic analysis based also on archeological, linguistic and folkloristic studies and investigations of the social structure and material culture of the peoples under discussion. Their anthropological characteristics are dealt with, and their ethnic distribution mapped. The Amur-Sakhalin region is considered the key area for the study of paleo-Asiatic (Paleosiberian) and Tungus-Manchurian racial types. The hypotheses of autochthonous Siberian (Baykal area) versus a southern origin of the Tungus and the related problem of the racial attribution of the neolithic Lake Baykal population are discussed. Author takes issue with Okladnikov's opinion (cf. No. 36586) that the Evenki (Tungus) are direct descendants of the neolithic cis-Baykal population and suggests the latter's cognation with a pre-Tungus, Paleosiberian (Yukaghir?) race. An area (not specified) in close proximity to the formative center of the Turkic- and Mongolian-speaking peoples is considered as the most likely Tungus place-of-origin. The problems of the "Eskimo wedge" and Eskimo origin are discussed at length (p. 206–248, 300–302). The similarities of artifacts and decoration patterns among the Old Bering Sea, Punuk, Ipiutak, Dorset and Sakhalin neolithic cultures point to an undisputable racial closeness. Levin disagrees, however, with the theory of a southern (Sakhalin) origin of the Eskimos and considers the Bering Sea area as their original homeland. A new classification of the Siberian and Far Eastern aboriginals into four racial groups is suggested: North-Asiatic, Arctic, Uralian and South-Siberian. Their anthropological characteristics are specified; the problem of the occurrence of an Americanoid type in the population of Siberia and the Far East is touched upon; Korean and Japanese anthropological types are considered in appendix. The insufficiency of anthropological data for conclusive ethnogenetic pronouncements is continuously stressed and the necessity for correlated studies of Asiatic and American aboriginals noted. ***Copy seen:*** DLC.

52786. LEVIN, MAKSIM GRIGOR'EVICH, 1904– . Ėtnograficheskie paralleli k neoliticheskim figuram ryb. (Sovetskai͡a ėtnografii͡a. Sbornik statei, 1939. no. 2, p. 171–74, illus.) 2 refs. Text in Russian. ***Title tr.:*** Ethnographic parallels to neolithic fish sculptures.

Describes the use (in 1927) of wooden or bone fish-like lures in the winter fishing of the Evenki (Tungus) of the Shamagir, Kindygir and Chel'chegir clans living in the northern cis-Baykal region. Similar stone fishes have been discovered by A. P. Okladnikov (cf. No. 53732) in neolithic sites of the Baykal area, a fact which may support the theory of a local autochthonous development of Evenki culture. However, as these fish-lures are also found among the Orochis, their use may simply reflect a primitive form of fishing. ***Copy seen:*** DLC.

52787. LEVIN, MAKSIM GRIGOR'EVICH, 1904– . Gruppy krovi u chukcheĭ i ėskimosov. (Sovetskai͡a ėtnografii͡a, 1958, no. 5, p. 113–16, tables.) 7 refs. Text in Russian. ***Title tr.:*** Blood groups of Chukchis and Eskimos.

A study of ABO and MN groups among 250 Chukchis from four localities and 65 Eskimos from a single settlement. There was a considerable variation in both blood groups among the Chukchis from different territories. Chukchis and Eskimos showed considerable similarity; however, the Chukchis showed a higher percentage of B and a lower of A than the Eskimos. Conditions are compared with the American Eskimos and Indians.

52788. LEVIN, MAKSIM GRIGOR'EVICH, 1904– . K voprosu o drevneĭshem zaselenii Sibiri. (Sovetskaîa ėtnografiîa, 1950, no. 3, p. 157–60.) 16 refs. Text in Russian. ***Title tr.:*** The problem of the first peopling of Siberia.

Recapitulates the findings of recent archeological expeditions and known facts on the distribution of early man along the upper reaches of the Ob' and Yenisey Rivers and in the Baykal region (Angara, upper Lena, etc.). The affinities between the Mal'ta and Buret' upper paleolithic and European late-Solutrian finds are noted. Okladnikov's theory (cf. No. 36584) on the settlement of Siberia by European tribes and their progressive mongolization, is disputed: west Siberian sites belong to a later period than those in the east; studies of the Baykal burials show its neolithic population to have been Mongoloid. As a cultural continuity between the paleolithic and neolithic eras has been established by Okladnikov, there should be no reason to attribute them to different racial stocks. The similarity of artifacts found in paleolithic sites of eastern Siberia and Europe is to be explained by identical climatic conditions, flora, and fauna, resulting in a correspondence of economic and cultural development; it does not imply identity of race. An original Mongolian population of northern Asia is therefore suggested.

Reviews studies at the Institute of Geology of the Arctic. According to the stratigraphic division worked out for the Quaternary deposits for the regions between Ural Mts. on the west and the Verkhoyansk Ridge on the east, the genera and species of fossil plants for each horizon are identified and their correlation is discussed. Sedimentary environments during various periods are interpreted and paleobotanical and paleoclimatic conditions considered.

Summary of the photographic experience of this expedition of 1952–1954, in northeast Greenland and on the inland ice, approx. 77°–78° N. Information is given on cameras, film, filters, exposure meters, and on the systematic recording and printing of photographs. Indoor lighting, arctic night, changing light of spring and autumn, summer and snow lighting effects are discussed. Temperature and humidity changes, maintenance of cameras, differences in focal plane shutter and film composition, and the development of film under local conditions are briefly considered

52800. LEWIS, HAROLD E., 1921– , *and others*. The food value of biltong, South African dried meat, and its use on expeditions. (British journal of nutrition, 1957 v. 11, no. 1, p. 5–12, plate, tables.) 17 refs. *Other authors:* J. P. Masterton *and* P. G. Ward.

A study of a traditional South African game (antelope) meat preparation, salted and dried in the sun. A cwt. of biltong was presented to the British North Greenland Expedition in 1952, whose members, almost all, enjoyed it without further preparation, during sledging, etc. Its history, preparation, composition,

nutritive and culinary value are discussed. It was found to be almost fat-free and to contain about 65% protein, 12.5% ash, a total calorific value of 416 Cal./100g. and a physiological calorific value of 312 Cal./100 g. ***Copy seen:*** DLC.

52801. LEWIS, HAROLD E., 1921– , *and* J. P. MASTERTON. A modern sledging ration. (Geographical journal, Mar. 1958. v. 124, no. 1, p. 85–88, 4 tables.) 3 refs.

This ration yields 4,800 Cal./man/day. The food and packaging are superior to the British North Greenland Expedition's ration with which it is compared. To lighten weight, disposable polythene and aluminum foil is used for packages; experimental containers of fiber-glass, vulcanized fiber, plywood banded with aluminum and plastic are being tried. Prototypes of the new ration are being tested in the Antaretic.

Copy seen: DGS.

52802. LEWIS, HAROLD E., 1921– , *and others.* Science on display: a modern sledging ration. (World science review, Aug. 1958, p. 21–22.) *Other authors:* J. P. Masterton *and* T. C. Gallant.

Describes ration boxes prepared for the British North Greenland Expedition of 1952–54. Standard daily ration of 4,200 Cal. was found insufficient; intake of 4,800 Cal. was required, due to work of travel and the cold environment. Improved and increased rations were provided; they were packaged in disposable units packs devised by the Metal Box Co. of London. Foil, polythene and other flexible wraps were used for individual items. Contents of a day's ration box for two men are listed.

Account of observations on the 29 men of the British North Greenland Expedition, 1952–54. Time of going to sleep and getting up varied greatly especially during the periods of continuous day and night when more time was used for sleep. Winter months were characterized by many interruptions of sleep and by taking of naps. Though no limits on sleep were imposed, the mean duration of sleep was 7.9 hours, approximately what is taken in temperate climate.

Twelve subjects living on two abnormal time rhythms on Spitsbergen (cf. No. 52807) were also studied as to their body temperature rhythm. The latter adapted almost immediately to the abnormal time routines in 11 out of 12 subjects, in

marked contrast to the excretory rhythms. Dissociation between the two thus appears to be common. Small-time differences in the function of the secretory components, also sometimes occur during the abnormal time schedule.

Trudy, 1957, vyp. 1, p. 93–120, tables, plates) 75 refs. Text in Russian. ***Title tr.:*** Distribution of micro-elements in the Siberian traps.

Outlines data on multiphases and on tuffic and intrusive facies and distribution of micro-elements in the trap formation area of the Siberian platform, extending from the Yenisey to the Lena and from Sayan north to the coast. The data are based primarily on spectroscopic investigation. Explosive, effusive and intrusive phases of trap volcanism are outlined. Geologic, petrographic and chemical peculiarities of intrusive rocks are treated. According to their age, the facies of traps are distinguished as: gabbro-diabases, porphyrites and the specially treated amygdoloidal gabbro-diabases. Each group is treated in turn and chemical analyses are presented. Distribution of accessory minerals and micro-elements (Cr, V, Ni, Co, Be, Rb, Pb, Sr, Ba, La and others) are described. Comparison is made between the composition of micro-elements of Siberian trap and similar formations of Lapland, Caucasus, Kamchatka, and other regions.

French version of this paper and No. 52818 was also issued: Expédition Internationale Glaciologique au Groenland, 1958–1959, Mésures de géodésie sur l'Inlandsis Groenlandais. Paris, Expéditions Polaires Françaises (19 p.), Copy at DN–HO.

Reviews experiences from previous geodetic investigations on the icecap and suggests procedures for the International Glaciological Expedition of 1957–60. The use of electronic equipment and other modern surveying methods are evaluated; problems of poor visibility and weather conditions are stated and measures to counteract them are suggested. Surveying procedures are evaluated, advantages of triangulation over trigonometric and polygonometric measurements in position establishment are pointed out. The refraction problem in trigonometric height-determinations is discussed in some detail, and means to reduce errors in measurements and computations are suggested. An arrangement for height-determination through automatic levelling is described and illustrated. The surveying of crevassed areas is stressed; employment of air photogrammetry on the west coast should be considered.

German. ***Title tr.:*** International Glaciological Expedition to Greenland, 1958–59.

Outlines features of the Greenland inland ice and achievements of major expeditions 1888–1954 (with map of icecap traverses). Main task of the 1958–59 expedition is to make meteorological measurements, especially of the lower 300 m. of the atmosphere, seismic measurements for determination of ice thickness and cartography of the ground beneath the ice, gravimetric and pendulum measurements for estimation of Greenland's isostatic orientation, and observations of surface ablation and growth of the ice. Research will be concentrated in a central zone, approx. 68°–73° N. with main axis along a 900 km. west-east profile from Disko Bugt to Røhss Fjord. ***Copy seen:*** DLC.

52840. LINDHOLM, G. F., *and others.* Geologic and engineering properties of silts near Big Delta and Fairbanks, Alaska. Ames, Iowa, Dec. 1, 1957. iv, 113 p. illus., 10 maps, 12 diagrs., 10 tables. (Iowa State College. Engineering Experiment Station, Final report I. Project 320–S. Contract NONR–530(04) Geography Branch, Office of Naval Research.) 37 refs. *Other authors:* L. A. Thomas, D. T. Davidson, R. L. Handy, *and* C. J. Roy.

Contains results of detailed field work in the Fort Greely (formerly Big Delta) area, and a reconnaissance study in the Fairbanks area, made in summer, 1955, following a preliminary study in 1954 (No. 41312). Geologic properties are summarized for samples taken; a number of chemical and engineering tests were made. In the Fort Greely area the most prominent geomorphic features are of glacial origin. Mineral composition of the silts bears a direct relationship to the bedrock in the area. Most samples have a textural classification of silty loam, a non-plastic or moderately plastic silty soil; are fair to very poor for use as subgrade material. In nearby areas underlain by permafrost, soils are poorly drained and are commonly in a soggy or saturated condition, and have little bearing capacity when wet. The Fairbanks silts differ from those at Fort Greely; they contain less mica, are finer textured, and generally more uniform in color, texture, and overall appearance. Permafrost is prevalent in much of the Fairbanks area. For engineering purposes, silts of the two areas generally similar, form fair to very poor subgrade material. Gravels are locally scarce, may provide aggregate for construction purposes.

Contains critical notes on seven palaearctic species of this sawfly genus, including *N. acuminatus*, native to Utsjoki in Finnish Lapland. *N. nigrosternatus*, recorded as a synonym of *N. caledonicus* from Kamchatka, and *N. kamchaticus* held as a synonym of *N. acuminatus* by Malaise, are recognized as extant species. ***Copy seen:*** DA.

52844. LINDROTH, CARL HILDEBRAND, 1905– , *and* T. PALM. Bidrag till kännedomen om coleopterfaunan i övre Norrlands kustland; faunistiska, ekologiska och djurgeografiska studier. Göteborg, Elanders boktr., 1934. 127 p. illus., map. (Göteborgs k. vetenskaps- och vitterhets-samhälle. Handlingar, 5. följden, ser. B, bd. 4, no. 3.) Text in Swedish. ***Title tr.:*** Contribution to the knowledge of the coleopteral fauna in the coastal region of upper Norrland, Sweden; faunistic, ecologic, and biogeographic studies.

Of the 3,600 species of beetles known in Sweden, 957 were found in a three weeks' study of the Norrland lowland. These are listed, with identification of forms not previously known from that latitude (63°–66°30′ N.) in Finland and Norway. Some are new to Swedish fauna. Influence of topography and climate on distribution, and migration are considered. All are post-glacial migrants to Sweden and origin is determined on the basis of species distribution: across Finland from the unglaciated regions of Siberia, across Sweden from central Europe, and across Norway from the ice-free localities of the west coast; the last least productive of species. Some species are biocentric. The role of rivers as routes of migration from northern to southern Sweden, and the obstructing effect of the border mountains are stressed. ***Copy seen:*** DLC.

52845. LINDROTH, CARL HILDEBRAND, 1905– . The faunal connection between Europe and North America. Stockholm, Almqvist & Wiksell, 1957. 344 p. 61 illus. incl. 46 text maps, 11 diagrs. 487 refs.

Contains a list (p. 15–134) of about nine hundred land and fresh-water animals (mammals, birds, fishes, insects, molluscs, etc.) common to Eurasia, and North America. A calculation made on the basis that these groups make up 17.3% of the entire terrestrial and limnic Swedish fauna, leads to a conjecture that the actual number of Eur-American non-marine faunal species amounts to more than 5,000. A large part of the species in common are regarded as introduced by man into either continent, or both, this element amounting to 41–46% (375–417 species). Species introduced from Europe into North America are about ten times as numerous as those transplanted in the opposite direction. Among groups treated, over 500 animal species are undoubtedly indigenous in both continents. Most of them possess a more or less continuous circumpolar distribution. Part of the Greenland and Iceland fauna immigrated across a Pleistocene land-bridge from the European mainland. The detailed comparative study of the Alaskan and northeast Siberian faunas is considered essential since the Bering land-bridge was the most important link toward evolution of the circumpolar fauna. ***Copy seen:*** DLC.

52846. LINDSTRÖM, MAURITS. A tectonic study of Mt. Nuolja, Swedish Lapland. Lund, 1955. (Geologiska föreningen, Stockholm. Förhandlingar, 1955, häfte 4, p. 557–66, text map, 10 diagrs.) 5 refs. *Also issued as:* Lund. Universitet. Mineralogisk och paleontologisk geologiska institutionerna. Skrifter, nr. 30.

Discusses axial elements of the fabric of an area of the overthrust Caledonian

metamorphics along the south shore of the lake, Torneträsk. Hard schists, mica schists, and marble are the principal rocks. Dips of s-surfaces, and directions of lineations were measured. The results at Mt. Nuolja are compared to those northeast of Pålnoviken, at the northwest end of the lake, which were reported earlier (No. 46373). ***Copy seen:*** DGS.

52847. LINDSTRÖM, MAURITS. Tectonic transports in three small areas in the Caledonides of Swedish Lapland. Lund, 1958. 85 p. diagrs., sketch maps, plates. (Lund. Universitet. Årsskrift, n.f. avd. 2, bd. 54, nr. 3) 36 refs. *Also issued as:* K. fysiografiska sällskapet, Handlingar, n.f. bd. 69, nr. 63.

Study of tectonic transport of overthrust Caledonian metamorphics is continued in three areas in Swedish Lapland, southwest of three areas previously studied (No. 46373, *infra*). A mean distance of ca. 17 km. separates centers of the six areas, along a line NNE–SSW. Three deformation phases are clearly discerned and described. In distinguishing between local and regional transport directions, the author states: "B′=a of the different phases dominate the fabrics. The symmetry of B′=a in highly plastic material is essentially axial, although the single case in a small enough subarea mostly deviates from this condition. A few local structures with Caledonoid (=b) trend seem to have been formed in anomalous stress field taken to be due to rotation of stresses in tectonic lea. *Boudinage*, in the original sense of the word, is caused by tension on a competent bed jacketed in between incompetent beds that are extended in the same direction and with the same velocity on both sides. Special conditions are indicated where this may occur." For each area the sections examined are geographically located and described. ***Copy seen:*** DLC.

52848. LINDSTRÖM, MAURITS. Tectonics of the area between Mt. Keron and Lake Allesjaure in the Caledonides of Swedish Lapland. Lund, 1957. 33 p. 2 plates, 32 diagrs., text map. (Lund. Universitet. Mineralogisk och paleontologisk geologiska institutionerna. Skrifter, nr. 37.) 22 refs. *Also issued as:* Lund Universitet, Årksskrift, 1957. n.f. avd. 2. bd. 53, nr. 11.

The geology of the area between Mt. Keron and Lake Allesjaure, southwest of Abisko in northern Sweden, is described. The rocks belong to the metamorphic nappe complex of the Caledonides. Axial fabrics and tectonic history are recognized in four main phases of deformation. The tectonic history differs from that suggested for the Pålnoviken and Mt. Nuolja areas (No. 46373 and 52846) for which revisions in interpretation are suggested. ***Copy seen:*** DGS.

52849. LINDSTRÖM, MAURITS. Toward a further hypothesis on the Scandinavian Caledonides. (Geologiska föreningen i Stockholm. Förhandlingar, no. 495, Nov.–Dec. 1958. bd. 80, häfte 4, p. 363–80, diagrs.) 85 refs.

The author's investigations of directions of lineations and s-surfaces in arctic Sweden (supra) and others' elsewhere reveal three main phases of deformation in the Scandinavian Caledonides. The first phase, with transport ESE, is believed to have affected the whole mountain chain; it is best preserved and dominates in the central part of the chain. The second, toward SSE, was effective mainly in the north and southwest. The last phase, S (and E), dominates locally in different parts of the chain. The method of investigation is explained in detail, and correlations are suggested between age of affected rocks and time of the different deformation periods. ***Copy seen:*** DGS.

52850. LINELL, KENNETH A., *and others.* Approach roads, Greenland 1954 program. Boston, Mass., May 1956. 36 p. illus., graphs, diagrs., tables. (U.S. Army. Engineer Arctic Construction and Frost Effects Laboratory. Technical report no. 64. *In:* U.S. Army. Corps of Engineers. Greenland ice cap research program, 1954. v. 2, *pub.* 1957.) *Other authors:* C. W. Fulwider, H. W. Stevens *and* A. T. Carozza.

Summarizes results of field work June 10–Sept. 10, 1954, by a party of four, near Thule. Two projects were carried on, developing effective methods and techniques for road construction and maintenance on bouldery, permafrost terrain, and on ice surfaces of the glacial type, as at TUTO Site; test land and road construction are described; soil properties, temperatures, thawing, are reported. ***Copy seen:*** CaMAI.

Text in German. ***Title tr.:*** The possibility of enforcing legal order among peoples with an acquisitional form of economy.

Discusses the concept and enforcement of law among primitive peoples including (p. 156–58) the Eskimos. Cases involving

crimes against the community, like killing of forbidden animals, violation of taboos, practice of black magic, concealment of miscarriages, etc., are judged by elders, council of hunters or the shaman, heeded not for their personal power but because of their prestige and economic importance. Crimes affecting individual members of the community like manslaughter, adultery, robbery, etc., are avenged by personal blood feud (slaying from ambush) or publicly held single combats (wrestling, fist fight). Among the most ancient forms of single combat practised by Eskimos is the singing contest where the two litigants insult each other in hour-long songs, the winner being often determined by public vote. Only in a few areas (chiefly in West Greenland) does this "spiritual" combat deteriorate into a scuffle.

Mentions the Angara expedition headed by A. P. Okladnikov who excavated 15 neolithic burials near Bratsk and a multilayer settlement at Monastyrskiy Kamen' with traces of neolithic, bronze and early iron age occupation; the west Siberian expedition under V. N. Chernetsov

surveyed the banks of the Kazym River from Yuil'skiy Gorodok to its confluence with the Ob'. ***Copy seen:*** DLC.

52861. LISITZIN, EUGENIE. On the reducing influence of sea ice on the piling-up of water due to wind stress. Helsinki, 1957. 12 p. tables, diagrs. (Finska vetenskaps-societeten. Commentationes physico-matematicae, t. 20, nr. 7.)

Presents a formula for the rise of sea level as a function of wind velocity, mean depth, and a coefficient α. Forty cases in the northern part (Bothman Bay) of the Gulf of Bothnia 1928–1942, with wind of average velocity at least 14 m./sec. and directions south-southwest, were studied. Data on the difference in sea level between Kemi and Vasa, the value of the coefficient α, and ice conditions are tabulated; α has a considerably higher value during the ice-free period than in winter months and decreases with increasing ice quantity. Comparative graphs show the average piling-up of the water surface for wind velocities 0–23 m./sec. (stipulated for 0–14 m./sec.) over a 100 km. distance for the ice-free season and for Feb./March, time of maximum ice coverage. The curves indicate a considerable reducing effect of the ice. ***Copy seen:*** DLC.

52862. LISTER, H., *and* P. J. WYLLIE. The geomorphology of Dronning Louise Land. København, C. A. Reitzel, 1957. 73 p. map, geol. sketch maps, diagrs., cross sections, illus. (Meddelelser om Grønland, bd. 158, nr. 1.) 37 refs.

"The solid geology and morphology of the landscape is described and an hypothesis of the process of advance and recession of the ice is postulated. Stages of glacial recession are constructed in north Dronning Louise Land and approximate dates given to these stages." The ice over Dronning Louise Land has been receding for the past two or three thousand years although five halt stages have been traced. Re-advance was of small importance though there is a suggestion of re-advance in the 18th century. Valley glaciers seem to be a powerful erosive agent, but the extensive ice sheet leaves far less evidence of great erosion. ***Copy seen:*** DGS.

Institut geologii rudnykh mestorozhdeniĭ, petrografii, mineralogii i geokhimii. Trudy, 1957. vyp. 10, p. 5–11, illus., tables.) 14 refs. Text in Russian. ***Title tr.:*** Datolite from Archeozoic calciphyres in the middle course of Kuranakh River in southern Yakutia.

Preliminary report on the characteristics and chemical and optical properties of this mineral recently found by the author, and for the first time in this area, on the bank of the Kuranakh, 10 km. east of the city of Aldan. All his finds of datolite were made in the contact zone between biotite porphyros and Archeozoic metamorphic rocks. Diopside and phlogopite-diopside calciphyres, with which datolite is bound, are described in detail. Results of the chemical and optical analyses are presented and explained. Comparison is made between the Aldan region datolites and those of the Tetyukhe River of Primorskiy Kray.

52865. LITTLE, C. GORDON. High latitude ionospheric observations using extra-terrestrial radio waves. (Institute of Radio Engineers. Proceedings, Nov. 1954. v. 42, no. 11, p. 1700–1701, graphs.) 4 refs.

Describes some preliminary investigations of the absorption of the diffuse background of extra-terrestrial radio waves and the scintillation of the intense localized radio sources in Cassiopeia and Cygnus. The observations were carried out at College, Alaska, over a two-month period in 1954, using a directional antenna coupled to a high-gain receiver, the output of which was recorded continuously by a pen-recording instrument. The ionospheric absorption on 65 mc. was strongly correlated with polar blackouts and variability in the earth's magnetic field; scintillations were observed

whenever polar blackouts or marked 65 mc. absorption occurred. The advantages of using extra-terrestrial waves for ionospheric studies, over the conventional echo-sounding techniques is pointed out. ***Copy seen:*** DLC.

Air-photographic survey and photo-interpretation methods used in study and mapping of soils in the U.S.S.R. and abroad are discussed. The Soil Institute of the Academy of Sciences has carried out systematic experimental work with these methods in various natural zones. The results are reported, including those from the tundra zone (p. 5–6) with photograph (fig. 1) of Yamal Peninsula tundra. ***Copy seen:*** DLC.

52872. LIVINGSTONE, D. A., *and others.* Effects of an arctic environment on the origin and development of freshwater lakes. (Limnology and oceanography, Apr. 1958. v. 3, no. 2, p. 192–214, illus., tables, maps.) 46 refs. *Other authors:* K. Bryan, Jr., *and* R. G. Leahy.

Account of investigations carried out during two summers in the Brooks Range and the Arctic Coastal Plain of northern Alaska. Climate, geology and vegetation of the area are sketched. The lakes visited (glacial, thaw, etc.) are described. Their origin and morphometry, physical conditions (temperature, heat balance, color, transparency, permafrost, etc.) chemical conditions and biology are dealt with in turn. Past conditions are reconstructed from analysis of sediments. The extended cold, seasonal distribution of insolation, and low precipitation have little direct effect on the life in far northern lakes, but the environment is a major factor in physical processes affecting origin, sedimentation and drainage. ***Copy seen:*** DLC.

52873. LIVINGSTONE, D. A. Pollen analysis of a valley fill near Umiat, Alaska. (American journal of science, Apr. 1957. v. 255, p. 254–60, diagr.) 6 refs.

Extends a three-zone pollen stratigraphy already established for the central Brooks Range (No. 41090) to the unglaciated foothills northward. In 35-ft. cores taken three mi. north of Umiat at 69°29′35″ N. 152°06′15″ W., no primary fossils or organic matter appeared in the bottom ten; in the upper 25 ft., an herbaceous, a birch, and an alder pollen zone were established. The boundary between the lower two zones has a radiocarbon age of 7,500–8,000 yrs., that between the birch and alder zones, approx. 6,000 yrs. Correlation with the central Brooks Range indicates that the postglacial thermal maximum occurred at about the same time in arctic Alaska as in the rest of the world. ***Copy seen:*** DGS.

(Annales de géophysique, 1956. t. 12, fasc. 4, p. 245–76, diagrs., graphs, errata: t. 14, fasc. 2, p. 239, 1958.) 25 refs. Text in French. Summary in English. ***Title tr.:*** Glacier mechanics, in particular near the front.

Contains a mathematical analysis of glacier mechanics, and explanation of phenomena which seem inconsistent with Nye's theory (No. 36524) such as the gentle surface slope in the center of the northern Greenland icecap and the finite gradient at the front. The gentle slope in the center is attributed to the stagnant ice there, suggesting a new theory of a reservoir glacier. A more accurate differential equation for the equilibrium profile is developed; successive approximations lead to a universal value of 29°36′ for the slope at the glacier front; this value agrees with observed values at the Thule ramp. Other phenomena are explained; criticism is made of the streamline hypothesis in the light of calculations of velocities near the glacier front made by the perfect plasticity theory.—From SIPRE. Nye's comments, with some criticism of Lliboutry's formulas, methods, etc., were pub. in *Journal of glaciology,* Oct. 1957, v. 3, no. 22, p. 91–93. ***Copy seen:*** DGS.

Outlines the relief, stratigraphy, volcanism, tectonics and geological premises of mineral resources. The 360,000 sq. km. area of the archipelago is divided into three groups of islands: northern, De-Long, consisting of Bennet, Genriyetty, Zhannetty, Zhokhova and Vil'kitskogo islands; the central islands: Anzhu, Kotel'nyy, Novaya Sibir', Fadeyevskiy, Bel'kovskiy, Figurina; and the southern group comprises Bol'shoy and Malyy Lyakhovskiy and Stolbovoy. This outline is based on the work of É. V. Toll', and later investigations of M. M. Ermolaev, T. N. Spizharskiĭ, E. S. Korotkevich, N. Iŭ. Zagorskaia. Deposits of the Cambrian, Ordovician, Silurian, Devonian, Carboniferous, Triassic, Jurassic-Cretaceous, Tertiary and Quaternary systems are summarized. Acid and alkaline intrusive and effusive magmatic rocks are characterized; tectonic developments are reviewed. Prospects for coal and other mineral resources are mentioned. ***Copy seen:*** DLC.

52878. LOBANOV, M. F. Geologicheskoe stroenie ostrovov Vrangelia i Geral'da. (*In:* Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Geologiia Sovetskoĭ Arktiki, 1957, p. 504–520.) Text in Russian. ***Title tr.:*** Geological structure of Vrangelya and Geral'da Islands.

Outlines the main features of relief and stratigraphy, volcanism and tectonics on the basis of the geological investigations carried out for Glavsevmorput' by L. V. Gromov, M. T. Kirĭushina (1935–36, 1939–40), V. M. Basov (1950–51), and A. A. Gorbunov (1952), mostly on Vrangelya Island. Stratigraphy of a cross-section of the sediments is briefly characterized. Intrusive and effusive rocks on both islands are reviewed. Tectonics of these islands are treated and their similarity with Chukotka folded zone is noted. Construction materials of practical importance may be found, and signs of metal ores are noted; hydrothermal development of ores is discussed. ***Copy seen:*** DLC.

52879. LOBANOV, M. F. Rudnye i nerudnye poleznye iskopaemye Sovetskoĭ Arktiki. (Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Informatsionnyĭ biŭlleten', 1957. vyp. 5, p. 11–21.) Text in Russian. ***Title tr.:*** Ore and non-ore mineral resources of the Soviet Arctic.

Reviews in general the mineral discoveries of the last forty years. Leading in importance are the copper and nickel of the Noril'sk region; and the tin, gold and wolframite under development in northeastern Asiatic U.S.S.R. General distribution of these minerals is given. Other minerals, of practical value as yet undetermined, are summarized. The Taymyr folded zone should be considered among the most promising regions, with its three ore-bearing sections: lead and zinc, arsenic-mercury, and wolframite-molybdenum. The Koryak Ridge is rich in ores with manganese, chromium, copper, mercury and tin prospects. Iron ore of Nizhnyaya Tunguska River region; magnetites of the Anabar plateau, titanium of the Kotuy, copper, lead and zinc of the Ural-Novozemel'skaya folded zone, lead and zinc of Novaya Zemlya and Vaygach island are mentioned. Non-ore minerals are diamonds, Iceland

spar, phlogopite, and coal. The locations are indicated and some information given.

52888. LÖVE, ÅSKELL, 1916– . Agamospermy in *Acetosa*. (Hereditas, 1949. bd. 35, häfte 3, p. 390–93.) 15 refs.

Reports observations of agamospermous seed formation of *A. arifolia*, *A. pratensis* and *A. thyrsiflora* from northern Scandinavia and Iceland. It is clearly facultative and occurs only in a low percentage of the ovules, highest in the northern material of *A. arifolia*, lowest in *A. thyrsiflora* from southern Sweden. Agamospermy met with in *A.* is genically determined, it is suggested, and the obligate agamospermy is the result of an unusual accumulation of genes for this abnormal type of seed formation.

Copy seen: DLC.

52889. LÖVE, ÅSKELL, 1916– , *and* P. SARKAR. Chromosomes and relationship of *Koenigia islandica*. (Canadian journal of botany, July 1957. v. 35, no. 4, p. 507–514) 59 refs.

The area of distribution of this hardy annual, restricted to the Arctic (Greenland, Iceland, Faeroes), is practically circumpolar. It is characterized by the tetraploid chromosome number 2n=28. Some species, often included in *Polygonum* s. lat. really belong to *Koenigia* in a somewhat wider sense. They are characterized by the basic chromosome number x=7, which is rare in the family and absent in the Polygoneae s. str. The subdivision of the Polygonaceae should be changed and the subfamily Polygonoideae should be "divided into two large subfamilies at the same time as *Koenigia* and its closest relatives be treated as a separate taxon at a very high level." ***Copy seen:*** DLC.

52890. LÖVE, ÅSKELL, 1916– . Cytogenetic studies on *Rumex* subgenus *Acetosella*. (Hereditas, 1944. bd. 30, häfte 1–2, p. 1–136, 213 illus., 19 tables.) 189 refs.

Four species which form an autopolyploid series with the basic number x=7, were studied, viz: *R. angiocarpus* (2n=14), *R. tenuifolius* (2n=28) from Murmansk on Kola Peninsula, *R. acetosella* s. str. (2n=42) northern Scandinavia and Iceland, and *R. graminifolius* (2n=56) Arkhangel'sk province. In *R. tenuifolius*, univalents are found at meiosis in almost all plants; and irregularities are met with in almost all individuals of *R. acetosella* s. str.; pollen fertility is good in all the species. Cross experiments between the different species yield no results, except when the hexaploid is pollinated with pollen from the tetraploid. The four

species are found to differ in minor morphological characteristics. The growth rate of the polyploid series becomes slower with an increase in the chromosome number. Differences between the sexes are observed in the content of ash, ascorbic acid, and chlorophyll. The three subgenera of *Rumex* are regarded as three parallel but different lines of evolution. The polyploid species of sg. *Acetosella* are very old species which have originated from the diploid by autopolyploidy. ***Copy seen:*** DLC.

52891. LÖVE, ÁSKELL, 1916– , *and others.* Cytotaxonomy of *Carex* section *Capillares.* (Canadian journal of botany, Sept. 1957. v. 35, no. 5, p. 715–61, 15 illus.) 412 refs. *Other authors:* D. Löve *and* M. Raymond.

This small section, *Capillares,* studied from the taxonomic and cytological point of view, comprises nine distinct species, one of which (*C. boecheriana*) is raised to specific status in this paper. Three of the species include two distinct subspecies each; and for two others, two varieties and three formae are accepted. "The chromosome numbers of the taxa involved are 2n=18, 36, 38, 40, 54, 56, and 58 . . . On the basis of karyotypic analysis of this section and other groups of the genus, it is concluded that primary basic number for the genus *Carex* in particular and the family Cyperaceae in general must have been X=5."—Authors' abstract. Of the material studied, at least seven species are native to Lapland, northern U.S.S.R., Greenland, Alaska, northern Canada and Baffin Island. The conspectus of species (p. 744–49) includes one new species, *C. boecheriana* endemic to Greenland, and *C. capillaris* with ssp. *capillaris* occurring in arctic Europe, Asia, and America, also ssp. *chlorostachys* in the Chukotsk Peninsula and Alaska.

52894. LÖVKVIST, BÖRJE. Experimental studies in *Cardamine amara.* (Botaniska notiser, Dec 1957. v. 110, no. 4, p. 423–41, illus., 10 tables.) 8 refs. Summary in Swedish.

"Determinations of chromosome numbers, cultivation experiments, induced polyploidy and artificial crossings have been carried out with *C. amara. C. amara* is diploid, 2n=16, all over its distribution area; at high altitude in the Alps, however, tetraploids, 2n=32, occur. Cultivation experiments show that some characteristics are easily modified. By colchicine treatment it was possible to study the same individual at diploid, tetraploid and octoploid level. Crossing experiments were carried out between *C. amara* and a number of other species. One hybrid only developed. However, it was found that in crossing between different species co-pollination was to be preferred."—Author's summary. The study was based partially on some clones from Jukkasjärvi, Tornehamn, in Swedish Lapland. ***Copy seen:*** DLC.

52895. LÖVKVIST, BÖRJE. De skandinaviska arterne i *Cardamine pratensis* komplexet. (Botaniska notiser, 1957. v. 110, no. 2, p. 237–50, 3 illus.) 20 refs. Text in Swedish. Summary in English. *Pub. also as:* Meddelanden från Lunds Botaniska Museum, nr. 117. ***Title tr.:*** Scandinavian species in the *Cardamine pratensis* complex.

Contains taxonomic, ecological and cytological data on three species, *C.*

pratensis, *C. palustris* and *C. nymani*, occurring in Scandinavia. The first species is represented only by tetraploids (2n = 30) while octoploid, decaploid, and dodecaploid populations of *C. palustris* occur. In the mountain region of Scandinavia (north to 68° N.), *C. nymani* occurs with a widespread octoploid form (2n=64) with orbiculate leaflets of the rosette leaves. *C. palustris* and *C. pratensis* often grow in the same locality. The higher the water content, the higher is the chromosome number of these plants.

52896. LOEWE, FRITZ PHILIPP, 1895– . Remarques concernant des mesures de température et d'accumulation sur l'Inlandsis groenlandais. (Annales de géophysique, Apr.–June 1957. t. 13, fasc. 2, p. 158–59.) 7 refs. Text in French. ***Title tr.:*** Remarks on measurements of temperature and of accumulation on the Greenland Inland Ice.

Calculates possible fluctuations of temperature and accumulation of the névé based on observations at Eismitte I. (No. 16545); at Eismitte II (No. 40355) at Northice (No. 45412); and subsequent calculations. Discusses changes of the past 20 years, comparing time and depth fluctuations. ***Copy seen:*** DLC.

52897. LOEWE, FRITZ PHILIPP, 1895– . Some early observations of the free atmosphere in high latitudes. (Meteorological magazine, Sept. 1957. v. 86, no. 1023, p. 276–78.) 32 refs.

Parry and Fisher probably made the earliest instrumental observation in the far North on Jan. 26, 1822, at Winter Island, 66°11′ N. 83°10′ W. (No. 13142). Also noted are the observations of: Back, Dec. 12, 1836, on the *Terror* off Southampton Island, 65°12′ N. 83°40′ W.; Bravais, Lottin and Martins during winter 1838 at Bossekop in Norway, 69°57′ N. 23°14′ E.; Andrée during balloon flight of 1897 in the Svalbard area; Wegener at Danmarkshavn in northeast Greenland, 76°46′ N. 18°45′ W., during Mylius Ericksen's expedition of 1906–1908; Hergesell, 1906 and 1910, at 79° N. and 76°30′ N. off west Vestspitsbergen. Observations in 1907 at Kiruna in Sweden, 67°51′ N. 20°13′ E., and those of Molchanov and Weickmann during the arctic cruise of the *Graf Zeppelin* in July 1931, are cited.

52899. LOEWENSTEIN, JOHN, *Prince*. The 'Eskimo *ulu*' in the Malayan neolithic. (Man, Mar. 1958. v. 58, p. 37–41, illus.) Refs.

Suggests that the Malayan stone blades and the Eskimo ulu or woman's knife have a common origin in the early Lake Baykal neolithic. The similarity of their semilunar shape, holes for handle attachment, use for scraping of hides or bark, and diffusion among the Mongoloid peoples, Chukchis, Asiatic and American Eskimos, and Algonkian and Tlingit Indians are discussed. The theories on prehistoric Eskimo migration are reviewed. ***Copy seen:*** DLC.

52900. LOEWENSTEIN, JOHN, *Prince*. Neolithic stone gouges from the Malay Archipelago and their northern prototypes. (Anthropos, 1957. v. 52, fasc. 5–6, p. 842–49, illus., map.) Refs.

Compares Malayan neolithic bone and polished stone gouges to similar chisels with concave cutting-edge occurring in neolithic sites in the Amur region, on the Angara and Yenisey Rivers, in the Western Urals, Finland and northern Norway. A north Eurasian origin of this timber-working tool is suggested.

Alaskan cities (13) are dealt with in p. 1–14, table 1, and part of fold. map. Surface water and ground water used in Alaska are mainly calcium bicarbonate in type. Concentration of dissolved solids ranges from about 16 to 450 ppm, and the hardness from about 6 to 300 ppm; these are summarized in table. Most supplies receive only chlorination. The 13 systems described serve some 53,000 people, approx. two-fifths of Alaska's population. Data include 1950 population records, population served, ownership, source and treatment of supplies, capacity of treatment plants, storage facilities, and chemical analyses of the water. ***Copy seen:*** DGS.

52916. LOSEV, BORIS IVANOVICH. Tverdyĭ benzin. (Sovetskiĭ soĭuz, 1958, no. 7, (101), p. 32–33, illus.) Text in Russian. ***Title tr.:*** Solid benzine.

The practicability of solid benzine has been tested in Antarctic and other remote places (deserts). Its structure is described (by its originator) as plastic emulsion with numerous fine cells, like honeycomb, filled by a special process with a liquid (benzine, kerosene, solar and mineral oils, butane, medicines, etc.). This emulsion is solidified and can be cut into bricks. Solid benzine contains about 95% pure benzine, burns slowly at the surface and is easily extinguished. A safe fuel, it can be transported on an open platform and stored anywhere, e.g. under water, snow or sand. Compression of the bricks yields fuel for engines or furnaces. ***Copy seen:*** DLC.

(Scientific monthly, May 1953. v. 76, no. 5, p. 259–76, illus., 12 text maps, 3 diagrs. table.) 38 refs. Based on a paper presented at the International Geographical Congress, Washington, D. C., 1952 (q.v.).

Summary of surveys made by author since 1928, while investigating chronology of the ice age for the American Geographical Society. "Presents outline of postglacial history in eastern North America furnished by records of upwarping. In the region of former glacial Lake Agassiz, the glacial Great Lakes, New England, Labrador, and arctic Canada, where there are raised marine or raised lacustrine shorelines, or both, the shorelines rise progressively higher in directions converging on the former ice cap center in Hudson Bay, indicating that crustal upwarp has been associated with removal of

ice weight." Profile and map of postglacial upwarp between southern New England and Hudson Bay, and a chronological table of postglacial time in eastern North America, based on successive regional uplifts and stabilities, are included. ***Copy seen:*** DGS.

A study of freezing damage to molecular constituents of the living cell, specifically the proteolipid of the red-cell membrane, the lipovitellin of egg yolk and the beta-lipoprotein of human plasma. The progressive removal of water during freezing was found to be harmful in all three cases studied. The protective action of glycerol is discussed within this concept.

52927. LOVELOCK, J. E. Diathermy apparatus for the rapid rewarming of whole animals from 0° C. and below. (Royal Society of London. Proceedings, 1957. ser. B, v. 147, no. 929, p. 545, illus.) ref.

Contains description of an apparatus designed by the author, and the principles of its operation. It is successfully used for rewarming larger mammals, e.g., rabbits. ***Copy seen:*** DNLM.

52928. LOVELOCK, J. E. The mechanism of the protective action of glycerol against haemolysis by freezing and thawing. (Biochimica et biophysica acta, 1953. v. 11, no. 1, p. 28–36, illus., tables.) 11 refs.

Account of investigations on human

erythrocytes frozen for brief periods to temperatures as low as −50° C. Addition of glycerol greatly reduced the concentration of electrolytes taking place in the cell during freezing. This concentration is largely responsible for the cold injury observed, and its reduction explains the protective action of glycerol.

52929. LOVERING, T. S. Halogen-acid alteration of ash at fumarole no. 1, Valley of Ten Thousand Smokes, Alaska. (Geological Society of America. Bulletin, Dec. 1957. v. 68, no. 12, part 1, p. 1585–1603, text map, 12 diagrs., 4 tables.) 17 refs.

Contains results of analysis of a series of specimens of ash and pumice, collected in 1952 by Wilcox outward from the throat of fumarole no. 1 of Zies (cf. No. 292). Appreciable quantities of lead, zinc, copper, arsenic, chlorine, fluorine, and sulfates were added to the innermost zone (1 in.), and nickel, cobalt, boron, and scandium were concentrated in the intermediate zone about 2 ft. from the throat. No carbonate is present in any zone. Magnetite, hematite, goethite, hydromica, opal, montmorillonite, and kaolinite are the chief alteration minerals. The alteration is similar to that produced by strong sulfur acids elsewhere; but differs from the latter chiefly in the greater loss of silka relative to alumina. Results of analyses are summarized in diagrams and tables. ***Copy seen:*** DGS.

52930. LOVING, HUGH B. Twin photography for mapping Alaska's Brooks Range. (Surveying and mapping, July–Sept. 1957. v. 17, no. 3, p. 263–69, illus., map.)

The planning and execution of precision aerial photography of this area are described. Planning began in Dec. 1954 and final agreement on the overall project was reached in May 1955. The required map specifications, the adverse weather conditions, and the necessity to keep field control to a minimum led to the choice of transverse twin low-oblique photography for the compilation. The procedures used in this mapping technique are explained in detail. Despite poor weather conditions over the area and low temperatures aloft (down to −85° F.) complete photographic coverage was obtained in two short seasons. The maps are to be published at scale 1:250,000 with a contour interval of 200 ft. The flight plan called for 22 east-west transverse twin low-oblique compilation flights at 30,000 ft. above mean ground, spaced 14 mi. apart.

52931. LOWIE, ROBERT HARRY, 1883– . Social organization. New York, Rinehart & Co., 1948. 465 p. Refs.

Deals with the principles and evolution of social organization in primitive and western cultures, with scattered references to Eskimos, Chukchis, Lapps and other arctic peoples. The social reorientation necessitated by a change from a sea-mammal hunting to a reindeer-breeding economy bringing with it concepts of individual ownership in contrast to the original communal economy are discussed (p. 26–30). ***Copy seen:*** DLC.

52932. LOWRY, ROBERT JAMES, 1912– . Chromosome numbers and relationships in the genus *Atrichum* in North America. (American journal of botany, May 1954. v. 41, no. 5, p. 410–14, 15 illus., table.) 10 refs.

The chromosome numbers of four species of the moss genus *Atrichum*, including *A. undulatum* occurring in Alaska, were determined. The basic chromosome number of the genus is seven. *A. undulatum* was found to be diploid (n=14); however, a dioicous, haploid collection of this species was discovered. Evolutionary processes other than polyploidy and gross structural changes in the chromosomes have played the greatest role in the development of the species. Only *A. undulatum* seems to have originated by apospory. Hybridization is also a factor in the evolution of the genus.
Copy seen: DLC.

52933. LOWRY, ROBERT JAMES, 1912– . A cytotaxonomic study of the genus *Mnium*. Brattleboro, Vt., E. L. Hildreth & Co., 1948. 42 p. 167 illus. (Torrey Botanical Club. Memoirs, v. 20, no. 2.) 76 refs.

Contains descriptions of 15 species of this moss and a correlation of their morphology with that of their chromosomes. The basic chromosome number for the genus is 6. It is suggested that *M. menziesii* be excluded from the genus *Mnium* and retained in the genus *Leucolepis*, on the basis of its 5 chromosomes, coupled with morphological differences. Three aneuploid species were found, *M. stellare*, n=7, *M. spinulosum*, n=8, and *M. punctatum*, n=7. At least eight

of the species are native to Alaska, northern Canada and Greenland.

52958. LUNDMAN, BERTIL. Publications on the physical anthropology of the Lapps. (Studia ethnographica upsaliensia, 1956. v. 11, Arctica, p. 277–84.) 78 refs.

Reviews works published from the 18th century to 1955 supplementing No. 24028, and revises his previously expressed opinion on the racial origin of the eastern Lapps. They are considered an aboriginal "local echo-type derived from

some eastern European" group with less mongoloid elements than believed earlier. Only slight similarities are found between their physical characteristics and blood-groups and those of north Russian and Siberian aboriginals. ***Copy seen:*** DSI.

52959. LUNDMAN, BERTIL. Züge der (vorcolumbischen) Anthropologie Amerikas. (Ethnos, 1955. v. 20, no. 4, p. 216–23.) Text in German. ***Title tr.:*** Traits of (pre-Columbian) anthropology of America.

Using the relation of skull-height to skull-length as an index for race study, author suggests that South and North America were settled by three different invasion waves crossing from Asia over Bering Strait, each wave pushing the preceding migrants south. A primitive low-skulled north-Mongoloid group was followed by high-skulled southern Eurasians. These in turn gave way to a low-skulled north Siberian tundra group that settled in the northern part of North America, mainly in the Bering Strait region. The seeming skull height of the Eskimos, placed into this last group, is due not to a high brain case (Hirnkapsel) but to a prominent sagittal crest (Scheitelkamm) resulting from overdeveloped chewing muscles. Certain anatomical peculiarities (oversized jaws, narrow nasal passages) of the present "Bering area peoples," i.e., the Chukchis and all Eskimos, are attributed to their physical adaptation to polar conditions. An analysis of their q genes also points to the existence of three different groups among the American aboriginals.

Ba, Översiktskartor med beskrivningar, no. 17.) 82 refs. Text in Swedish. ***Title tr.:*** Description accompanying the soils map of Sweden.

The origin, division, and localization of Sweden's unconsolidated earthy mantle are outlined and 15 soil provinces described. The soil materials are mainly of glacial, alluvial, aeolian, and organic origin and are characterized according to thickness, particle size, stratification, climate and site effects, natural fertility, and use. The three soil provinces which extend into arctic Sweden are: (1) the northern interior lowland with almost equal proportions of moraine and bogland; (2) the mountain foreland with greater area of moraine and less of bogland; and (3) the upland with bogland predominating over glacial deposits and frost-weathered accumulations, and with much more bare rock than is found at lower elevations. Special attention is devoted to the conventional division of bogs into "mossar" (*Sphagnum* or white moss) and "karr" (sedge or brown moss); to aeolian sands in several locations; to palses on the upland which are reportedly confined to peatbogs where the temperature decreases to −10° C. 120 days annually; and to frozen-ground accumulations, generally above the treeline, and their relation to inclination, vegetation, and content of stones. All sketch maps, diagrams, and photographs have titles in both Swedish and English.

Sbornik, no. 45, p. 52–77, illus., diagrs., maps.) 39 refs. Text in Russian. ***Title tr.:*** Some results of aerogeological investigations in West Siberia; sketch of the newest tectonic movements.

Reports air survey in the region 58°–64° N. from the Ural foothills to the Ob' depression for geologic mapping at scale 1:one million. The air survey contributed substantially to the detection of recent tectonic movements, which are characterized. General uplift of the region in the present period is evident. Special characteristics in the land forms reveal that this uplift was preceded by elevation of the Severnaya Sos'va River and depression in the Konda region. Relief development, post-glacial hydrography and morphology are also reviewed. The various geologists who participated in this large-scale work are mentioned.

Formation and growth processes of various types of lake, river, and sea ice and influencing factors are discussed on the basis of the literature. Ice-crystal formation is discussed in chap. 1; lake water temperature distribution during the pre-freezing period and static and dynamic ice formation are described (chap. 2). River ice, including the water-temperature regime before and during ice formation, is treated in chap. 3 The formation of sea ice is examined (p. 52–76) including a description of the thermal regime, ice in seas of low and high salinity and in arctic waters. Basic types and forms of sea ice are described and illus. (p. 76–103). The growth and deformation of sea ice and the effects of hydrometeorological factors on the ice cover are discussed (p. 103–110). Ice forecasting methods are also considered.

Occasionally in the fall season, a rich plankton fauna is observed in Norwegian coastal waters as far north as Varanger. The biology of pelagic animal forms and their drift with the Gulf Stream are discussed. *Salpa fusiformis* is the most common species found on the Norwegian coast. ***Copy seen:*** DGS.

52986. LYONS, JOHN C. Sixty thousand square miles of potential resources, Newfoundland and Labrador. (Canacian mining and metallurgical bulletin, Feb. 1958. v. 51, no. 550, p. 114–19, 3 illus., 2 text maps.) Talk given at Montreal Branch meeting of the Canadian Institute of Mining and Metallurgy, Nov. 27, 1957, illustrated by a colored movie on a recent survey of the Hamilton River power project.

Gives account of progress made by British Newfoundland Corp. Ltd., in exploring and developing natural resources of Newfoundland and Labrador, including minerals, timber, water power. The Corporation's organization in 1953, its 20-year concessions (map) and program are outlined: mineral exploration, reconnaissance and mapping, etc. Uranium mineralization was discovered in Labrador, diamond drilling and an adit carried out. Cost estimates, including construction of an all-weather road between the Hamilton River and the Iron Ore Company's railway, have been completed in the water-power program. Stands of pulpwood amounting to 8 to 10 million cords, mostly black spruce, in Labrador, are noted. ***Copy seen:*** DGS.

52993. MacCARTHY, GERALD RALEIGH, 1897– . Glacial boulders on the arctic coast of Alaska. (Arctic, 1958. v. 11, no. 2, p. 71–85, illus., 2 maps, 2 tables.) 6 refs. Paper presented at the Geological Society of America meeting in Durham, N.C., Apr. 1955; abstract listed as No. 41169.

Reports incidental observations made in the Barrow-Cape Simpson area 1949–50. Pleistocene glaciers of Alaska did not extend north beyond the northern foothills of the Brooks Range, yet glacial boulders have been reported near and along the coast. Altogether 56 such erratic boulders from sheltered spots on the shore, as far as 8–9 mi. inland on the tundra and a few from the present sea floor were examined. Their location and size, rock type with field description and petrographic analysis are tabulated. Of granite (16), diabase (17), quartzite (10), etc., they range in weight from 2–3 lbs. to 4–5 tons. They are thought to represent morainic material left by melting icebergs, and the bergs to have been produced from glaciers in widely separated areas.

"Present methods, reviewed and evaluated on the basis of a literature survey, include thawing prior to excavation by solar heat, steam jets, water and electric needles, valveless pulsejet engines, and hydraulic methods as well as fracturing by hand, with saws, drop and pneumatic hammers, and cutter and scraper blades. The potentiality of resonant sound waves for loosening frozen ground should be studied. Modifications of bulldozers to permit installation of pneumatic hammers horizontally along the base of the blade show considerable promise. The use of alternate cutter and scraper blades for trench excavation has proved satisfactory. Drop hammers are suitable for enlarging excavations. Sawing frozen ground has not yielded satisfactory results."—SIPRE.

52996. MacDONALD, M. A., *and* **J. M. BELL.** Effects of low fluctuating temperatures on farm animals, 1; influence of ambient air temperature on the respiration rate, heart rate and rectal temperature of lactating Holstein-Frisian cows. (Canadian journal of animal science, June 1958. v. 38, no. I, p. 10–22, illus., tables.) 20 refs.

Account of observations at daily minimal temperatures ranging from −5° to 38° F. As environmental temperature fell, heart rate and rectal temperatures increased while respiration rate decreased. The three parameters were not significantly correlated with each other; however, change in respiratory rate was positively correlated with change in rectal temperature ($P<.03$). Low temperature resulted in small change in these physiological characteristics but the animals were not entirely free of thermal stress at temperatures as low as 0° F.

53001. MacFARLANE, IVAN C. Guide to a field description of muskeg. Ottawa, Jan. 1957. 35 p. illus., tables. (National Research Council of Canada. Associate Committee on Soil and Snow Mechanics. Technical memorandum, no. 44.)

Contains criteria for identification of various types of muskeg or organic terrain. Twelve percent of Canada's terrain consists of muskeg, which causes difficulties for surface transportation and engineering works. Nine classes of surface coverage are summarized, each illus. by photo. Sixteen types of topographic features, found in muskeg areas, are briefly described, and 16 categories of subsurface material, or peat, are named, broadly characterized and illus. This guide, to help classify and describe muskeg types, standardize terminology, and help solve engineering problems, is based on the descriptive system of N.W. Radforth. ***Copy seen:*** DGS.

MacFARLANE, IVAN C., *see also* Radforth, N. W., *and* I. C. MacFarlane. Correlation of palaeobotanical and engineering studies of muskeg . . . *1957.* No. 54188.

53002. MacFARLANE, M. A. The Wadsworth Orthogonal Polynomial Technique over the North Polar area during 1955. Montreal, Oct. 1957.

Unpaged. 9 diagrs., 5 tables. (McGill University. Arctic Meteorology Research Group. Contract AF 19(604)–1141, Scientific report no. 3, supplement no. 1.) 4 refs.

Contains a summary of results obtained in the specification of pressure patterns for a trial series of Edmonton charts, using the Wadsworth Orthogonal Polynomial method; computations were carried out on the IBM 704 computer at the United Aircraft Co. at East Hartford, Conn. The trial series consists of the daily and 5-day mean surface and 500 mb. maps for the entire year of 1955, over the Arctic Meteorology Group's standard 13 x 13 grid area. Objective of this study is to show usefulness of the Wadsworth System: it seems to work better in polar than in middle latitudes.

53003. MACFARLANE, W. V., *and* **J. D. MEARES.** Intracellular recording of action and after-potentials of frog muscle between 0° and 45° C. (Journal of physiology, June 1958. v. 142, no. 1, p. 97–109, illus., tables.) 16 refs.

Resting potential increased but slightly between 0° and 35° C.; some muscles maintained voltage in cold as well as in heat. Duration of action potential increased below 10° C. with a Q_{10} of 2.7 to 4.1. After potential was lost in the cold (below 5° C.). ***Copy seen:*** DLC.

53004. McGILL, JOHN T. Map of coastal landforms of the world. (Geographical review, July 1958. v. 48, no. 3, p. 402–405, col. map in pocket.) 5 refs.

First of three maps and a handbook, coast studies by the U.S. Office of Naval Research. Based on Briesemeister's equal-area world projection, in scale 1:25,000,000. Distribution of major classes of coastal landforms (plains, plateaus, hills, mountains), as well as presence of embayments, is shown on coastal outline. Colors identify the principal agents shaping major landforms and shore features. Generalization of complex character of some landforms and omission of local shore features is explained in text. A coastal strip extending inland about 5 to 10 miles is arbitrarily classified on the map: the scale permits identification of types of features 10 to 15 miles in extent. All arctic coasts are classified; Antarctica is omitted. An extensive bibliography is to be issed separately. ***Copy seen:*** DGS.

53005. McGINNIS, JOHN M. Effectiveness of prototype cold weather face masks for military activities. June 1957. 46 p illus. (U.S. Quartermaster Corps. Environmental Protection Research Division. Technical report EP–60.) 58 refs.

Contains a survey of Quartermaster research on face protection under severe windchill conditions, and evaluation of two new face masks: "Cold bar" and "Wood-Hafferty." The latter was found to be highly acceptable to operators of open engineering equipment, tank commanders, sappers, etc. The coldbar was preferred by gunners, physically active. Both masks increased the effectiveness and comfort of their wearers.

53006. McGLYNN, J. C. Tumi Lake, District of Mackenzie, Northwest Territories. Ottawa, 1957. Report, 6 p., and map 9–1956. (Canada. Geological Survey. Paper 56–4.) Ref.

Report contains geological notes on the area, 63°15′–63°30′ N. 116°30′–117° W. Map, scale 1:63,360, shows areal distribution of ten types of Proterozoic and one type of Ordovician rocks, and structural and glacial notes. Mineral occurrences are located. Base map of the area, located about 100 mi. northwest of Yellowknife, was compiled from vertical aerial photos. ***Copy seen:*** DGS.

53007. McGOWAN, RICHARD E. Mt. Logan-Cook expedition, 1953. (American alpine journal, 1954. v. 9, no. 1, p. 32–38, 3 illus.)

Account of expedition, June 15–Aug. 14, 1953, by four Seattle climbers; objectives were: a new route to summit of Mt. Logan (unsuccessful), and two unclimbed peaks, Mt. McArthur, and Mt. Cook, the former near Mt. Logan, the latter (climbed Aug. 1) near Yakutat Bay. Routes are described; problems of manpower, communications, weather, etc. are noted. ***Copy seen:*** DGS.

53008. MacGREGOR, C. W. *and* **N. GROSSMAN.** Dimensional effects in fracture. (U.S. National Bureau of Standards. Circular, May 1952, no. 520, p. 137–52, illus., diagrs., graphs, tables.) 19 refs.

The influence of size on the transition temperature from ductile to brittle fracture, the effect of various ratios of combined stresses on the brittle transition temperature, and the effect of combined stresses on fracture strength were studied, using specimens of steel containing 0.95% carbon. Size-effect tests on circular disks supported around the circumference and loaded by a concentrated force at the center, showed that a 6-in. disk had a transition temperature 8° F. higher than a disk of 1-in. diameter. Rectangular plates, supported on two sides and loaded by a central concentrated force, were used to study the influence of biaxiality of stresses: the biaxiality ratio varied from 0.483 to 1.0, the brittle transition temperature increased 62° F. Conclusion: brittle fracture strength increases markedly with increasing constraint effect; a decrease in size also causes a definite increase in fracture strength.

53015. McINTYRE, DONALD G., *and* **H. E. EDERSTROM.** Metabolic factors in the development of homeothermy in dogs. (American journal of physiology, Aug 1958. v. 194, no. 2, p. 293–96, illus.) 11 refs.

Study of dogs 1–25 days old exposed to 5°, 23° and 30° C. When 1–5 days old and exposed to 5° or 23° C., the animals showed a rise of 20–25% in metabolic rate and a fall in rectal temperature. Exposure to 5° C. at an age of 11–21 days caused a fall of about 75% in metabolic rate and rectal temperature fell several degrees in an hour. Finally, exposure to 5° at an age of 21 days, caused a 75% metabolic increase with a rise of only 1° in rectal temperature. Mature dogs under similar conditions show no drop in rectal temperature and a metabolic increase of 80%.

53016. MACKAY, JOHN ROSS, 1915– . The Anderson River map-area, N.W.T. Ottawa, Queen's Printer, 1958. 137 p. illus., 27 maps, graph. (Canada. Dept. of Mines and Technical Surveys. Geographical Branch. Memoir 5.) 115 refs.

Contains detailed terrain analysis of the area 68°–70° N. 120°–128° W., but including the northern tip of Parry Peninsula and the Cape Bathurst area; based on author's field work and on air-photo interpretation; conditions are described as of 1955. Three physiographic provinces: the Canadian Shield, interior plains, and arctic coastal plains, impose contrasts in terrain and resources on this area. The geology, physiography, glaciation, post-glacial submergence, and geomorphic processes are described for the whole area; and the eight major physiographic regions are treated in turn. Climatic conditions are summarized; data were interpolated from records at Port Radium and Coppermine. Two general vegetation areas (with and without trees) are noted; four vegetation zones are recognizable: open woodland, woodland-tundra, scrub willow-ground birch, and tundra. Human geography is reviewed: settlement and exploitation by white men discussed as well as culture of the Eskimos and the Hare Indians. Population of the map area has averaged 75 since 1930, unevenly distributed, and that is about all the area can support under its present hunting-fishing-trapping economy. Numerous illus. of terrain features are included, also maps showing location and distribution of geologic, geographic, climatic, and botanical elements. ***Copy seen:*** DGS.

Abstract of paper presented at 53rd Annual Meeting of the Association, Apr. 1–4, 1957, Cincinnati, Ohio. Nicholson Peninsula (69°54′ N. 129° W.) and Herschel Island differ from the adjacent coastal plain in being considerably higher and having deformed sediments; probably caused by pressure of glacier ice against topographic obstructions or by drag effect of the ice. Slight evidence suggests sediments were unfrozen at time of deformation. ***Copy seen:*** DGS.

53019. MACKAY, JOHN ROSS, 1915– . A subsurface organic layer associated with permafrost in the Western Arctic. Ottawa, Queen's Printer, 1958. 12 p. illus., 3 text maps, 2 diagrs. (Canada. Dept. of Mines and Technical Surveys. Geographical Branch. Geographical paper no. 18.) 19 refs.

Contains results of study of a discontinuous subsurface organic layer of varying thickness, lying close to the permafrost surface in extensive areas. Field work was carried out in summers of 1955-1957, (in 1956 at the Engigsteiak archeological site, Firth River, Yukon Territory). Distribution of organic layers is widespread in the Canadian Western Arctic. Most of the organic material is partly decomposed and dark gray in color; the organic layer is usually located at the bottom of the active layer, at the top of the permafrost zone, or in both. Some layers are estimated to be thousands of years old. Three theories of origin are considered: marine burial, convective circulation, and progressive burial (favored by the author) with slow development, giving a record of former climates and (in inhabited areas) archeological evidence. Maps and diagrams illustrate an example studied near King Point, Yukon Territory.

53022. MACKWORTH, NORMAN HUMPHREY. Cold acclimatisation and finger numbness; field and laboratory studies. Report prepared for the Climatic Efficiency Sub-committee of the R.N.P.R.C. London?, 1953. 26 p. plates, diagrs. (Great Britain. Medical Research Council. Royal Naval Personnel Research Committee.)

Field studies on the numbing effects of cold were carried out at Fort Churchill, Mar. 1949 on a test group of 30 men, aged 18–32, half completing their first winter, half with two winters in arctic conditions. The tests consisted of two series of experiments: a tactile, two-point discrimination task (the V test), and a vibration threshold method. In addition, the results obtained by the two methods were compared and assessed. The laboratory (cold room) studies at Cambridge, Eng., were used to "develop and extend the meaning" of the field results. With slight winds (4–6 mi./hr.), there was a significant difference in numbing, and performance, between men spending most of their time indoors and those active outdoors, indicating a degree of cold-acclimatization in the latter. Laboratory experiments gave additional support to this conclusion.

53026. McLAREN, I. A. The biology of the ringed seal, *Phoca hispida* Schreber, in the Eastern Canadian Arctic. Ottawa, 1958. 7, 97 p. illus., tables, maps. (Canada. Fisheries Research Board. Bulletin no. 118.) 52 refs.

A study of this animal, particularly off southwest Baffin Island and in northern Foxe Basin, with emphasis on growth, reproduction and distribution. These seals grow from 65 cm. to about 135 cm. in length. Both sexes mature in the seventh year. Duration of rut, ovulation, implantation, gestation, parturition are dealt with and the influence of food and geographic latitude on size is analyzed. Food and food preferences, and fasting, are described, as introductory to the study. Moulting, migration and distribution, morphometry, etc., are also discussed. Study was made intermittently between 1947 and 1955 partly from the *Calanus*.

Gordon Mines Limited. (Precambrian, Mar. 1957. v. 30, no. 3, p. 11–13, diagr., table.)

Crushing plant and concentrator was winter-freighted from Sherridon 150 mi. north to Lynn Lake (56°51′ N. 101°03′ W.). The deposits contain nickel-copper-cobalt ore, occurring in basic intrusive rocks either as massive sulfides, disseminated sulfides, or as stringers of sulfides in the fractured host rock. Most troublesome gangue minerals are talc and actinolite. Crushing (coarse underground, fine at surface), grinding, flotation, separation, cleaning of concentrate and impounding of tailings are described.

53028. McNARY, WILLIAM F., *Jr.* Progressive cytological changes in the hypophysis associated with endocrine interaction following exposure to cold. (Anatomical record, June 1957. v. 128, no. 2, p. 233–50, illus., tables.) 19 refs.

Account of experiments with rats exposed to an environment of 6° to 10° C. Exposure for 1–10 hrs. produced an increase in the number of phospholipid-producing cells in the anterior hypophysis. Long exposure (1–61 days) produced changes in the hypophysis indicative of increased thyrotrophin secretion; after 30 days the thyrotrophs showed a cytological evidence of cold-adaptation while the phospholipid cells remained augmented throughout the whole period of exposure. Adrenalectomy, alone or combined with cold stress or cortisone, epinephrine, demedullation of adrenals, etc., were also studied as to their effects upon hypophyseal cytology.

53029. MACNEIL, FRANCIS STEARNS, 1909– . Cenozoic megafossils of Northern Alaska. Washington, D.C., U.S. Govt. Print. Off., 1957. p. 99–126, text map, 7 plates, 3 tables. (U.S. Geological Survey. Professional paper 294–C.) 55 refs.

Contains study of marine invertebrates obtained from later Tertiary and Quaternary beds on the arctic coastal plain: Tertiary fossils obtained from near Carter Creek (approx. 70° N. 145° W.); consisted of gastropods, pelecypods and a few scaphopods, brachiopods, cirripeds and worms. From the Quaternary Gubik formation, fossils were obtained in four localities on the arctic coastal plain: gastropods and pelecypods, and a few cirripeds and worms. Each species is described; most are compared with other species elsewhere; distribution is summarized in tables. Close relationship is noted with corresponding North Atlantic and European Tertiary fossils, indicating possible entry of Atlantic elements into the polar sea at that time. The presence of several non-synchronous and isolated zones of near shore facies in the Quaternary formation indicates a period of oscillating shore lines.

Summarizes work and significant findings in northern Canada and Alaska during summer 1957. Four aboriginal sites were discovered in the Lake Hazen-Ruggles River region of Ellesmere Island and investigation of these sites, on the hypothetical migration route from the American continent to Greenland, is planned by the National Museum of Canada for the 1958 field season. J. Meldgaard resumed his excavations (cf. No. 41349) at Alarnerk, Melville Peninsula, concentrating on the site's early pre-Dorset remains dated approx. 3,400 years ago by Carbon 14; the artifacts show close affinities to Alaska's Cape Denbigh Flint Complex and Greenland's Sarqaq culture; toggle-head harpoons earlier than hitherto known were found; no transition elements into Dorset appeared among the pre-Dorset remains. The excavations by W. E. Taylor of Dorset sites on Payne Lake and Payne River, northern Ungava Peninsula; author's discovery of 97 sites (including 28 micro-blade) in southern Yukon Territory; I. Skarland's survey of "Yuma" projectile sites in the interior of Alaska; and G. Lowther's discovery

of 14 sites in the Old Crow Flats in Yukon Territory are noted.

Describes 13 new species of mosses and liverworts preliminary to publication in No. 55032; together with a few old species. *Bryum* (*Rhodobryum*) *ontariense* n. sp., hitherto confounded with *Bryum roseum* and common throughout Ontario, is included. ***Copy seen:*** DLC.

53034. McPHEE, DUNCAN S. Preliminary report on Eric Lake area, Saguenay electoral district. Quebec, 1958. 5 p. fold. map. (Quebec. Dept. of Mines. Geological Surveys Branch. Preliminary report, no 369.) 5 refs.

Maps (1 in.:1 mi) and outlines the geology of this 320 sq. mi. area (51°45′–52°10′ N. 65°35′–50′ W.) its northern boundary at Mile 154 on the Quebec North Shore and Labrador Railway. The consolidated rocks, all of Precambrian age consist of metasedimentary gneisses, granite gneisses, gneissic granite, gabbro, diorite and various minor dykes. Bands of paragneiss form the main structural unit; the variety of differences within them appears to be due to original compositional differences in the sedimentary beds. Structural trend of the gneisses is northeast, with asymmetrical and cross folds producing a generally complex structure, jointing prominent in some. Gabbro intrusives in the north cut across the trend of the gneisses. No concentration of economic minerals was found within the map-area.

53035. MacPHERSON, ANDREW H. Arviligjuarmiut names for birds and mammals. (Arctic circular, 1958. v. 11, no. 2, p. 30–33.)

Lists with their English equivalents the names used by natives of Pelly Bay for 41 birds and 21 mammals.

Copy seen: CaMAI.

53036. MacPHERSON, ANDREW H. Ornithological research at Pelly Bay in the summer of 1956. (Arctic circular, Aug. 1958. v. 11, no. 1, p. 11–13.)

Describes experiences during field studies on the Canadian arctic coast (approx. 68°53′ N. 89°51′ W.) on the relationships of *Larus* gulls. ***Copy seen:*** CaMAI.

MacPHERSON, ANDREW H., *see* Manning, T. H., *and* A. H. MacPherson. The mammals of Banks Island. *1958.* No. 53109.

53037. MacPHERSON, BILL. Miners of the permafrost. (Imperial oil review, Apr. 1957. v. 41, no. 2, p. 18–21, illus.)

Discusses permafrost and supply problems at the North Rankin nickel mines on the northwest coast of Hudson Bay. The entire 300 ft. mine shaft is in permafrost, hence the mine cannot be heated above 20° F. and there is hazard of condensation from the hot air used in underground drilling. Supplies must be brought in by air or sea; diesel fuel was delivered in 1956 by the *Firbranch*, first oil tanker to navigate into Hudson Bay. It is expected that 250 tons of ore will be milled daily and reduced to 55 tons of concentrate. ***Copy seen:*** DGS.

53038. MacPHERSON, BILL. Snowball express to Moak Lake. (Imperial oil review, Feb. 1958. v. 42, no. 1, p. 28–32, illus., map.)

Describes haul of 38,000 tons of goods in northern Manitoba, during winter 1956–57, from Thicket Portage (55°20′ N. 97°42′ W. on the Hudson Bay Railway) to Thompson, approx. 25 mi. distant, and to Moak Lake, 20 mi. beyond Thompson. The operation, using tractor-drawn sleigh-trains, was carried out for International Nickel Co. of Canada by Patricia Transportation Co. Ltd. Although −50° F. temperatures caused tractor breakdowns from metal fatigue, crystallization of snow, and obliteration of stencil ink on labels, the job was completed in three months on a 24-hr.-day, 7-day-week schedule. Construction at the mine sites, plans for the town of Thompson, rail connection with the Hudson Bay Railway and between the Thompson and Moak Lake sites, and a power plant development at Grand Rapids on the Nelson River are noted. Production is expected to begin in 1960 and to reach 75 million lbs. of nickel annually.

53039. MADSEN, CHARLES, 1884– , *and* **J. S. DOUGLAS.** Arctic trader. New York, Dodd, Mead, 1956. 273 p. plates.

Account of Madsen's life from about 1900, first as a trader along the Siberian coast and in the Nome area, later as a hunter of polar bear and walrus on the Alaskan and Siberian coasts till about 1915. Customs of Chukchis and Eskimos are described in some detail. A trading expedition through the Northwest Passage initiated upon conversation with Roald Amundsen at Nome in 1906, was abandoned due to severe ice conditions. After several years of storekeeping in Kodiak (till 1929), Madsen became a professional guide. Photographs (31) of native life and sea hunting.

53041. MAEHLUM, BERNT. The diurnal- and sunspot-cycle variation of the layers E, F^1 and F^2 of the ionosphere as observed in Norway during the period 1932–1956. Oslo, H. Aschehoug, Feb. 1958. 14 p. tables, diagrs. (Norske videnskaps-akademi i Oslo. Geofysiske publikasjoner, v. 20, no. 6.) 6 refs.

Discusses diurnal variation of the critical frequencies of the *E*- and F^1-layers, and seasonal and sunspot-cycle variations of the critical frequencies of the *E*-, F^1-, and F^2-layers and the transmission factor ($M3000$)-F^2, based on observations at Kjeller (near Oslo), Tromsø (69.7° N. 18.9° E.), and (partly) Longyearbyen (78°10′ N. 15°30′ E.), Vestspitsbergen. Linear correlation was obtained between the critical frequencies and the 13-monthly running mean of the sunspot number, *W*. The sensitivity of the critical frequency to sunspot activity for the *E*- and F^1-layers showed a clear maximum in summer; noon values of the sensitivity of the F^2-layer showed a minimum in summer. Diurnal variations of $f_0 F^1$ were in accordance with a $\cos^n \chi$-law; n varying with season and latitude. Good correlation was found between ($M3000$)-F^2 and *W*. ***Copy seen:*** DGS.

Compares the 1938, 1951–52 and current Russian language instruction in elementary and high schools for Yakutia, the far North (Chukchi, Koryak, Eskimo, Gold, Tungus, Lamut, Ostyak, Vogul, Samoyed), etc. Increasing stress is laid

on study of Russian, taught now through all grades. ***Copy seen:*** DLC.

53060. MAKAROV, P. Vyshe uroven' raboty nerusskikh shkol. (Narodnoe obrazovanie, Feb. 1955. no. 2, p. 8–20, illus.) Text in Russian. ***Title tr.:*** Raise the level of studies in non-Russian schools.

Criticism by the deputy chief of the Main Administration of Schools of the Ministry of Education of R.S.F.S.R. of the teaching methods and educational program of non-Russian schools, including those of northern minorities. Teaching is conducted in the native language through the seventh grade (end of junior-high school) in Yakut and Zyryan schools; to the second grade in Nenets (Samoyed), Ostyak, Vogul, Evenki (Tungus), Lamut, Gold, Koryak, Chukchi and Eskimo schools. Though tuition of Russian is started in the first grade and the curricular load is 13–15% higher than in Russian schools, the students' progress is slower and the average educational standard lower. Unsatisfactory results in Russian and native languages is ascribed to poorly compiled textbooks and inadequate teaching methods. The entire program for non-Russian schools, training of qualified teachers, etc., needs to be revised.

Issledovaniîâ moreĭ SSSR, 1936. vyp. 24, p. 185–221, illus., tables, map.) 14 refs. Text in Russian. Summary in German. ***Title tr.:*** Hydrological studies in the Kara Strait during the summers of 1932 and 1933.

A study of currents, tides and tidal currents, temperature and salinity in this strait between Vaygach and Novaya Zemlya. Conditions in all these aspects were highly complicated and irregular. Most currents are wind produced and swift, reaching 2.12 knots. Tidal currents are weak except in the southeastern part where they attain 2.45 knots. Salinity and temperature are affected by the Pechora discharge on one hand, and ocean water coming from the west, on the other; currents and tides further complicate these conditions.

53069. MAKSIMOV, IGOR' VLADISLAVOVICH. Nutat͡sionnye îâvleniîâ v atmosfere vysokikh shirot zemli i ikh klimatoobrazuîûshchaîâ rol'. (Problemy Severa, 1958, vyp. 1, p. 97–115, diagrs., tables, maps.) 24 refs. Text in Russian. ***Title tr.:*** Nutation phenomena in the atmosphere of high latitudes and their role in the formation of climate.

The study of 14-month nutational fluctuations of the mean sea level caused by fluctuations of the instantaneous axis of the earth's rotation and producing the so-called "polar tide," suggested the possibility of similar phenomenon in atmosphere. Detailed analysis of atmospheric pressure, observed in 14-year periods of 1903–1916 by 194 stations and of 1922–35

by 182 stations, revealed the existence of 14-month fluctuations of atmospheric pressure with maximum amplitude of 0.64–0.94 mm. at 70° N., producing the standing wave of baric "polar tide." Data on latitudinal distribution of the phenomenon and its periodic fluctuations are given; features of the circumpolar baric wave and of its rotation are discussed in detail. Interrelation of the 14-month nutational and 12-month seasonal fluctuations of atmospheric pressure is analyzed and its effect on the climatic conditions in the polar regions indicated.

MAKSIMOV, NIKOLAĬ IVANOVICH, *see* Voskoboĭnikov, M. G. Chukotka . . . *1957*. No. 55891.

53070. MALAGIN, ALEKSANDR PAVLOVICH. Magadanskiĭ ėkonomicheskiĭ raĭon. Magadan. Magadanskoe knizhnoe izd-vo, 1957. 119 p. illus., tables, fold. map. 8 refs. Text in Russian. ***Title tr.:*** The Magadan economic area.

Outlines economic progress and development of the mining industry during the Soviet period in the far northeast of Asia. This province, over 1,200,000 km.² in area, comprises Chukotka, Vrangel Island, the upper Kolyma and Indigirka basins and the northwestern coasts of Okhotsk Sea. Its geography and the economy of its 15 administrative districts (eight in the Chukotsk National District), their population and industrial centers are outlined (p. 11–26). Exploration of the area, gold, tin and coal discoveries, rise of the mining industry and improvement of its technical equipment are reviewed (p. 26–72). Factory and workshop, transportation and construction data are given (p. 72–83); reindeer, livestock and vegetable growing by collective and state farms (p. 83–96); fisheries and hunting, local light industry and food industry (p. 96–104) and development prospects (p. 104–117) complete the survey. Activities of the Main Administration of Construction in the Far North (Dal'stroĭ, founded in Nov. 1931, and transformed into the Magadan National Economic council in 1957) are noted, also those of organizations responsible for geological prospecting. Scarcity of population in this area is stressed: in 1941 it averaged only 31 per 1000 km.² in the 720,000 km.² Chukotsk National District. Fold. map 1:20 million shows boundaries of the province, main population centers, distribution of mining and industry. ***Copy seen:*** DLC.

53071. MALAISE, RENÉ EDMOND, 1892– . Oceanic bottom investigations and their bearings on geology. (Geologiska föreningen, Stockholm. Förhandlingar, 1957. bd. 79, häfte 2, no. 489, p. 195–224, 6 text maps, 7 diagrs.) 35 refs.

On the basis of ocean bottom investigations, changes in climate, ocean currents, and sea level, constriction and expansion of the earth's crust, and foundering of mid-Pacific and mid-Atlantic land masses are discussed. The origin of the glacial period in the Northern Hemisphere is related to restriction of warm water flow into the Arctic, and its termination to the breaking down of the land bridge between Greenland and Europe which permitted entrance of the Gulf Stream into the Arctic Basin. Zonal distribution of land plants around the North Pole is believed to have been constant since the Eocene, although floral characteristics changed with climate. The related effects on climatology, biogeography, archeology, and movements and migrations of peoples are noted.

53072. MALANDIN, M. M. Novye dannye po stratigrafii i uglenosnosti Sangarskogo raĭona Lenskogo uglenosnogo basseĭna. (*In:* Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Trudy, 1956. t. 89, Sbornik stateĭ po geologii Arktiki, vyp 6, p. 42–58, fold. cross-section, diagr., tables.) 5 refs. Text in Russian. ***Title tr.:*** New data on the stratigraphy and coal-bearing capacity of the Sangar district in the Lena coal basin.

Two cross-sections are presented of the Sangar area (64°–64°30′ N. 126°–127° E.) coal-bearing deposits. Types of coal seams are examined and the chemical composition and petrographic characteristics of the coal are given. Field investigation was made by the author, and two lithologists, A. S. Zaporozhtseva and T. M. Pchelina, in 1954. The coal, due to specific carbon-forming material and richness in bitumen and tar, seems of value for the chemical industry. Stratigraphy of the coal stratum is also treated, and the flora and fauna characterized. ***Copy seen:*** DLC.

monde moderne. (Société royale de Geographie d'Anvers. Bulletin, 1956. t. 68, fasc. 1–4, p. 6–13.) Ref. Text in French. ***Title tr.:*** The fate of the kings of Thule: prospects suggested by the integration of the Eskimo into the modern world.

Discusses the problem of the ethnic survival of Eskimos (total: 52,000; Asia: 1,292; Alaska, 21,135; Canada; 7,700; Greenland: 22,000). Threatened by the industrial and military outposts of the white race, Eskimos may disappear or lose their racial purity (over one-third of Greenland's Eskimos are of mixed blood) unless they adapt themselves to the changing economic and social conditions of the Arctic and sub-Arctic. A parallel cultural evolution is mandatory to avoid the Eskimos' exploitation as unskilled labor. ***Copy seen:*** DLC.

Presents results of two years' work on existing glaciers in the Koryak mountain area, 60°17′–63° N. 166°35′–176°30′ E. Through field investigation and airphoto survey, 282 active glaciers were identified, occupying 179.87 km². They are concentrated in seven regions, and for each, the glaciers are enumerated (with areas) and characterized. Maps show districts and distribution of the glaciers. Features of glaciation, glacier basins, and types of glaciers are outlined. The snow line is indicated for various mountains; the nourishment and wastage of the glaciers are discussed. ***Copy seen:*** DLC.

53091. MAMEN, CHRIS. Mining in Scandinavia; part 1, some Norwegian operations. (Canadian mining journal, Dec. 1957. v. 78, no. 12, p. 59–70, illus., text map.)

Three mines and one hydro-electric tunnelling project are described, viz: Skorovas (64°45′ N. 14° E.), Fosdalens Bergverk (64° N. 11° E.), Løkken (63°06′ N. 09°43′ E.), and Fortun hydro-electric power project (61°29′ N. 07°42′ E.). A brief historical account; description of ore bodies; mining methods, illustrated by photos and sectional diagrams; compressed air supply; transportation of ore; pumping; and miscellaneous notes are given, with a few brief, important features of each mine preceding the account. Some comparisons with Canadian mining methods are suggested. The Løkken mine has produced iron and copper ores for more than 300 years.

53092. MAMEN, CHRIS. Mining in Scandinavia; part 2, operations in northern Sweden. (Canadian mining journal,

Jan. 1958. v. 79, no. 1, p. 67–77, illus.)

Describes mines visited in Aug.–Sept. 1957, viz: Kiirunavaara, open pit and underground; Malmberget; Renström, Långsele (Boliden). Mining operations, transportation of ore, crushing, measuring, ventilation and other features of the Renström and Långsele mines (64°50′ N. 20°20′ E.) are noted. Differences from Canadian practices and features otherwise of interest to Canadian operators are stressed. ***Copy seen:*** DGS.

53093. MAMEN, CHRIS. Mining in Scandinavia; part 3, operations in south-central Sweden. (Canadian mining journal, Mar. 1958. v. 79, no. 3, p. 71–78, illus.)

Describes three mines visited in Aug.–Sept. 1957: Grängesberg, Stora Kopparberg (Falun) and Bodås, producing iron, copper and iron, respectively. Brief remarks on reserves, ownership, history of the mines, ore deposits, mining methods, development practices, transport hoisting, production, and miscellaneous details are given. Stora Kopparberg is the world's oldest continuous mining operation, having owned its royal charter for more than 600 years; it was one of Europe's chief sources of copper. ***Copy seen:*** DGS.

53094. MAMEN, CHRIS. Mining in Finland; part 4, mining, milling, smelting Outokumpu copper ore. (Canadian mining journal, May 1958. v. 79, no. 5, p. 73–81, illus., 6 tables.) Final report of this series on mining in Scandinavia and Finland.

Describes mining operations, also milling and smelting aspects of large, state-owned producer. Principal mine is the Outokumpu; reserves of about 13 million tons of ore grade 3.8% copper, plus small amounts of iron, sulphur, zinc and other minerals. Mining methods, with diagrams, use of roof bolts, hauling and hoisting of ore, crushing, concentrating and flotation, illustrated by a flow sheet, are noted for the Outokumpu mine. Flash smelting process used at Harjavalta is explained, with a flow sheet and a table of operating statistics. During the Russian-Finnish war, the smelter, located previously near the new boundary line, was moved *in toto* crosscountry to Harjavalta. ***Copy seen:*** DGS.

53098. MANITOBA. MINES BRANCH. Annual report for period ending March 31st, 1957. Winnipeg, Queen's Printer, 1958. 16 p. illus., map. (Dept.

of Mines and Natural Resources, Ann. Rept. p. 9–23.)

Reviews developments in the Manitoba mining industry Apr. 1956 through Mar. 1957. After ten years' exploration by the International Nickel Co. of Canada, Ltd., two mines were to be put into production in the Mystery Lake-Moak Lake area. Hudson Bay Mining & Smelting Co. Ltd. discovered a major zinc deposit and a copper deposit in the Herb Lake area. Production of the Sherritt Gordon Mines Ltd. plant at Lynn Lake declined slightly. Activities of the Geological Division and other offices of the Mines Branch are summarized; production is tabulated, operating companies are listed. ***Copy seen:*** DGS.

53099. MANITOBA. MINES BRANCH, Annual report for period ending March 31st, 1958. Winnipeg, 1958. 19 p. illus., text maps, diagrs., tables.

Reviews developments of 1957, the most active prospecting period and one of the most successful periods of mine development for Manitoba. Notes progress at the two new International Nickel Co. of Canada, Ltd. mines in the Mystery-Moak Lakes area; at the Hudson Bay Mining and Smelting Co. Ltd. deposits near Chisel Lake; increased tonnage at Sherritt Gordon Mines Ltd.'s Lynn Lake plant; extensive exploration.

53101. MANKER, ERNST MAURITZ, 1893– . Den bottniska skidtypen i nya myrfynd. (På skidor, 1957. p. 167–82, illus., map.) 7 refs. Text in Swedish. ***Title tr.:*** The Bothnian ski type in new bog finds.

Lists 13 finds, in north Sweden, of this ski type: short and broad, lancet-shaped tip, flat ungrooved underside, and a raised concave foot plate, set in from the sides and sloping backwards. The skis are described in detail; sites of the finds, also described, are shown on map. An intermediate type between arctic and Bothnian skis seems to be represented in one of the finds. ***Copy seen:*** SPRI.

53102. MANKER, ERNST MAURITZ, 1893– . Lapparna inte längre nomader; ett apropå till dagens läge. (Norrbotten. Norrbottens läns hembygdsförening. Årsbok 1957, p. 7–14, illus.) Text in Swedish. ***Title tr.:*** The Lapps no longer nomads; a note on the situation today.

Traces the history of the Lapps from prehistoric times, and describes the development from reindeer-hunting to -husbandry. Reindeer-herding nomads were always a minority and the nomadic culture was mainly created by the Scandinavian inland Lapps. The yearly cycle of migration is described. Most Lapps have given up their nomadic life and nowadays the reindeer are tended by special herders using modern transport.

53103. MANKER, ERNST MAURITZ, 1893– . Lappland i besittning. (Till fjälls, 1957. årg. 29, p. 8–11, illus.) Text in Swedish. ***Title tr.:*** Conquest of Lapland.

The last remnants of the ice age had disappeared from Lapland about 8,000 years ago, and the oldest dated archeological finds are about 5,000 years old (tools, skis, etc.). The racial characteristics of the Lapps are discussed. Two interesting early finds are probably relics of visitors to Lapland.

Copy seen: DLC.

53104. MANKER, ERNST MAURITZ, 1893– . The last of the reindeer Lapps. (Natural history, Feb. 1958. v. 67, no. 2, p. 70–81, 20 illus.)

A remnant of a separate paleo-arctic race, the Lapps (or Fenni, self-appellation Samer) evolved from reindeer hunters to herders, most of them, adopting a semi-nomadic life with hunting, fishing and primitive farming. Their origin, physical characteristics, former religious beliefs (animism, shamanism) are dealt with and some statistical data on present population and reindeer given. The changing ways of life of the truly nomadic Lapps, the reindeer herders of the Scandinavian interior, are discussed. Their annual

migration routes, adaptation to nomadic conditions (ambulatory tent, *kata*, and boatlike sledge, *akja*), their working team, *sita*, combination of private and communal ownership, etc., are described and the present transition to an industrialized reindeer economy with meat production as its main objective is sketched.

Copy seen: DSI.

53105. MANKER, ERNST MAURITZ, 1893– . Nomaderna, de bofaste och Kvikkjokksledens resenärer. Föredrag vid Svenska naturskyddsföreningens opinionsmöte i Stockholm för bevarandet av Lilla Lule älvs sjösystem. (Samefolkets egen tidning, Apr. 1957. årg. 39, nr. 1, p. 2–5, illus.) Text in Swedish. ***Title tr.:*** The nomads, the settlers and the Kvikkjokk route travelers. Lecture given at a meeting of Svenska naturskyddsföreningen (Swedish Association for the Protection of Nature) in Stockholm in support of preserving the Lilla Lule River lake system.

Traces the history of the Lilla Lule River valley (approx. 66°30′–67° N. 18°–20° E.) from the time of the stone age nomadic reindeer hunters to the present. In 1657 silver was found north of Kvikkjokk, mining was started and in the 1670's the first agricultural settlers came to the district. Some well-known travelers in the region are mentioned, beginning with Carl von Linné in 1732.

53106. MANKER, ERNST MAURITZ, 1893– . Sista rajden. (Svenska turistföreningen. Årsskrift, 1957, p. 108–126, 11 illus., text map.) Text in Swedish. ***Title tr.:*** The last reindeer caravan.

Changing conditions in reindeer husbandry in arctic Sweden are noted: the last migration, in which family tents were packed and carried by reindeer, took place in late summer, 1954. The author accompanied Lapps on this trek from Parajaure, at the edge of the summer pasture on Padjelanta through valleys of the Sarek massif to Nanto. Family cooperation in the undertaking is emphasized, and experiences en route are recounted. ***Copy seen:*** DGS.

53107. MAN'KO, M. A. Degradiruet li "vechnaîa" merzlota pochv v raîone g. Mezeni? (Akademiîa nauk SSSR. Izvestiîa, ser. geograficheskaîa, May–June 1958, no. 3, p. 60–64, table, graph.) 17 refs. Text in Russian. ***Title tr.:*** Is permafrost degradation in progress in the Mezen' district?

Reports that rapid degradation of permafrost soils reported by N. G. Datskiĭ (1937) and M. I. Sumgin is not in agreement with author's observations of 1940 in the district of Mezen' (approx. 65°50′ N. 44°16′ E.). The permafrost degradation found by Datskiĭ in Semzha and Mgla area was under peat cover and represented man's destruction of the peat. Permafrost (the continuous or island types) in the drifting peat bogs is similar in structure and distribution to that in other regions of European Russia. Sumgin's assumption on changes of climate is also deemed unfounded: climatological data for Arkhangel'sk indicate temperature variations but not a general warming trend to support an hypothesis of permafrost degradation. Destruction of the peat cover may lead to local degradation.

53127. MARCUS, MELVIN G. Glacier studies in Alaska, 1957. (American alpine journal, 1958. v. 11, no. 1, issue 32, p. 39–43.) Ref.

Brief account of progress by four field parties sponsored by the American Geographical Society. Project 4.11 surveyed Worthington Glacier near Thompson Pass (61° 09′ N. 145° 45′ W.), Polychrome Glacier in Mount McKinley National Park, and West Gulkana Glacier in the Delta River area. Large scale maps (1:5000, 1:10,000) are in preparation. Juneau Ice Field research project carried out field work June 5–17 and Sept. 1–16, mainly on Lemon Creek Glacier. Final (tenth) year's work is planned for 1958. In project 4.2, a reconnaissance survey of numerous accessible glaciers in southeast Alaska was made; a field party of seven examined 15 glaciers, June–Aug., then continued glacial studies near Prince William Sound. Project 4.17 plans a detailed study of McCall Glacier in the Brooks Range, especially its microclimate for correlation with the arctic ice pack. ***Copy seen:*** DGS.

53128. MARDOIAN, M. G., *and others.* Winterization of construction equipment; report of CIMTC Sub-committee XV, winterization. (SAE transactions, 1957. v. 65, p. 349–76, illus., maps, tables, diagrs., graphs.) *Other authors:* F. M. Baumgardner, J. A. Klisch, T. H. Fones, W. W. Cornman, A. Q. Spitler *and* P. W. Espenschade.

Presents joint report (seven papers, two appendices, discussions) of this subcommittee and the Engineer Research and Development Laboratories' Winterization Section, on low-temperature operation of vehicles. A condensed version of the report was listed as No. 46617. Introduction (p. 349–53) reviews background of the program directed toward: fundamental information on characteristics of equipment and material at temperatures to −65° F.; study of systems and techniques permitting successful operation at such temperature (emphases on proper engine operation and improvement of the operator's environment, i.e., heating, accessibility to controls, escape hatches, etc.); and possible standardization of winterizing equipment used on construction machinery. Civil and military activities in arctic areas are outlined in relation to equipment requirements. Studies are reported on a motor grader and three tractors designed (by Austin-Western, Caterpillar Tractor, International Harvester, or Allis-Chalmers Mfg.) with a different approach to winterization in compliance with ten basic requirements (listed); all the equipment to be

serviced with arctic military fluids, lubricants, hydraulic fluids, and antifreeze (cf. table). Subsequent to assembly and servicing, each was tested in cold room at −25° and −65° F.; field tests were conducted during winter 1955–56 at Aurora, Minn., and 1956–57 tests to be made in Alaska. Each of the winterized vehicles is described in turn, major modifications are illustrated. Results of starting tests are summarized, mechanical deficiencies, cause and corrective action are tabulated, and the warm-up time graphed. In conclusion, by P. W. Espenschade (Engineer Research and Development Laboratories), military-industry liaison is outlined; overall performance factors, deficiencies of specific features and/or their arrangements are reviewed and recommendations are made to further development. Ease of maintenance accessibility check-off chart is appended. ***Copy seen:*** DLC.

53129. MARENINA, T. Ю. Geologo-petrograficheskiĭ ocherk Mutnovskogo vulkana. (Akademiîa nauk SSSR. Laboratoriîa vulkanologii. Text in Russian. ***Title tr.:*** A geologic and petrographic outline of the Mutnovskiy Volcano

Monographic study of Mutnovskiy Volcano, called also Mutnovskaya or Povorotnaya Sopka, on the southeast coast of Kamchatka (52°27′ N. 158°11′ E.), based on published literature and on author's investigations in 1948 and 1952. The orography and stratigraphy of the area are outlined and a detailed geomorphic, petrographic and mineralogic description is given of the piedmont, slopes and parts of the volcano, including its two craters, lateral cones, fumaroles and hot springs. Data from chemical and physical analyses of the main rocks, lavas, pumice, tuffs, sublimates and gases are included. The present activity of the volcano is limited to vapors from fumaroles of the northeast crater (p. 44–49). History of the volcano's formation is sketched (p. 49–51); photographs and a geological text map amplify the text.

53135. ***MARINE ENGINEERING AND SHIPPING REVIEW.*** USNS *Eltanin*, a prototype ship for MSTS. (Marine engineering and shipping review, Feb. 1958. v. 63, no. 2, p. 49–57, illus.)

Contains a detailed description with plans for the first of three diesel-electric cargo ships (class T–AK–270) to be built for polar work of the Military Sea Transport Service, by Avondale Marine Ways, Inc., New Orleans. The vessel generally is of welded-steel construction; it is strengthened by an ice-belt of high-tensile steel plate covering from 3 ft. above the deep-load line to 3 ft. below the light-load line. The displacement on full load is 4,942 tons. Maneuvering the two propulsion motors is carried out either from the engine room or from remote-control stands in the wheel house and the ice-pilot station, which contains duplicate navigational equipment for use by an observer during operations in ice.

Copy seen: DLC.

53136. ***MARINE ENGINEERING/LOG.*** USNS *Point Barrow*, cargo ship (dock). (Marine engineering/log, Aug. 1958. v. 63, no. 9, p. 49–56, illus., diagrs.)

Describes in detail, with profiles, deck and machinery plans, this vessel designed for lighterage operations of arctic outposts. Main specifications are: length over-all 465½ ft., displacement 9,415 t., turbine propulsion engines of 6,000 hp., cruising speed 15 knots and cruising range 10,000 mi. Provisions are made for emergency dry-docking of small craft; draft can be increased by eight ft. in less than 30 min. A 1¼ in. high-tensile-strength steel ice belt girds the vessel, a three-in. blanket of fibrous glass insulates living and working spaces. The twin propellers are of nickel-aluminum bronze alloy. Design criteria allow for 100 knots max. wind velocities and −65° F. min. temperature.

The study consists of a general part (p. 5–40) dealing with the current status of this branch of parasitology in the U.S.S.R.; morphologic-anatomical outline of the group; its ontogeny, biology and injurious effects. The special part (p. 41–245) offers descriptions of nearly 200 species parasitizing on both freshwater and sea fishes of the Soviet Union. Synonymy, morphology of both sexes, host(s) and area or organs affected, also geographic distribution are discussed. A considerable number of these parasites are reported from arctic waters.

53139. MARKIN, ARKADIĬ BORISOVICH. Ėpokha velikikh rabot. (Druzhba narodov, Apr. 1958. no. 4, p. 167–79.) Text in Russian. ***Title tr.:*** The era of great undertakings.

Describes Soviet industrial achievements including the power stations on the Ob, Yenisey and Angara Rivers. Lack of foresight is criticized in some of the projects: unavoidable flooding of the West Siberian plains by the reservoirs of the Ob super-hydro-complex; building the Irkutsk power installation without locks, thus destroying possibility of a Kara Sea - Lake Baykal - Pacific Ocean waterway, etc. Projects of the future are

considered: a bridge or tunnel across Bering Strait to join Eurasia and America; railroad connecting the Trans-Siberian line with the Bering Strait, Yakutsk with the Sea of Okhotsk, and a railroad down the Kamchatka Peninsula; creation of an artificial warm current by pumping water through the Bering Strait thus drawing warm Atlantic ocean water into the Arctic Basin. ***Copy seen:*** DLC.

53140. MARKIN, ARKADIĬ BORISOVICH. Strategiîa velikikh rabot; zametki inzhenera. (Novyĭ mir, Jan. 1957, no. 1, p. 225–37.) Text in Russian. ***Title tr.:*** Strategy of great undertakings; notes of an engineer.

Describes visit of a committee of scientists from the Academy of Sciences in Moscow to its East-Siberian branch at Irkutsk, as introduction to a critical appraisal of research-development projects in that, and other, areas. In general, centrally approved industrial undertakings are not coordinated with other, local, projects and their future side-effects, as distinct from the main objective, are not sufficiently considered in advance. For example, the Irkutsk hydro-electric station has its dam built without locks, cutting off all water traffic to Lake Baykal, thus killing hope of a future waterway connecting Kara Sea with the Pacific, via the Yenisey, Angara, Lake Baykal, Selenga and Amur Rivers. The Lena railroad built without consideration of the Angara cascade scheme is now threatened with partial flooding by the Bratsk hydro-electric station dam. Ruthless deforestation has stripped the lower Angara region due to the lack of railroads to the taiga hinterland. The planned construction of the Ob River power stations, whose dams are to convert 35 million hectares into an artificial sea, will submerge invaluable mineral resources and destroy the agricultural potential of a large part of western Siberia by raising its already high ground-water level, etc. Discrepancies between the claimed and actual geological exploration of the lower Yenisey-Lena region are criticized; the accidental discovery of natural gas at Tas-Tumur (70°40′ N. 131°15′ E.) and Zhigalovo on the Angara River, is noted, etc. ***Copy seen:*** DLC.

53141. MARKIN, ARKADIĬ BORISOVICH. Velikoe dvizhenie na Vostok. (Druzhba narodov, Feb. 1956. no. 2, p. 121–32.) Text in Russian. ***Title tr.:*** The great movement to the East.

Discusses the industrial potential of Siberia, including: hydro-electric power stations on the Angara, Ob and Yenisey Rivers, discovery of natural gas at Berezovo on the lower Ob, rock-salt deposits along the Lena. Plans are advanced for linking the White Sea and the Pacific Ocean by a railroad and waterway system and the construction of an electric railroad from Irkutsk to Cape Dezhnev. The harnessing of Siberian rivers is essential to increase power production and local resource development for industrial purposes in the East. ***Copy seen:*** DLC.

53142. MARKIN, ARKADIĬ BORISOVICH. Zaglîanem v budushchee. (Vokrug sveta, Nov. 1957, no. 11, p. 17–25, illus., maps.) Text in Russian. ***Title tr.:*** Let us look into the future.

Discusses large-scale construction plans including M. M. Davydov's suggestions to redirect waters of northern rivers toward the south; water power developments on the Ob, Yenisey and Angara Rivers for hydro-electric stations; A. I. Shumilin's project to construct a dam across Bering Strait, etc.

Helsingfors, 1954. 23 p. 10 maps. (Finska vetenskaps-societeten. Årsbokvuosikirja, 1952-1953. v. 31B, no. 3.) Text in Swedish. ***Title tr.:*** Seed development without pollenization and consecutive multiple variation therewith in plants; lecture before the Finnish Scientific Society's meeting April 20, 1953.

The development of viable seed by certain plant species lacking stamens and pollen, both naturally and experimentally, and the occurrence of multiple varieties within these species are discussed. Agamogenesis, chromosome counts, hybridization, plant migration, and multiple variations of *Ranunculus, Alchemilla, Hieracium,* and *Taraxacum* are considered. Some forms appear to have become locally established in postglacial locations and even in historical times. Several of the varieties are found in far northern as well as other Scandinavian localities. ***Copy seen:*** DGS.

53144. MARKOV, F. G., *and others.* Geologicheskoe stroenie Taĭmyrskogo po-

luostrova. (*In:* Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Geologiia Sovetskoĭ Arktiki, 1957, p. 313–87.) Text in Russian. *Other authors:* M. G. Ravich *and* V. A. Vakar. ***Title tr.:*** Geological structure of the Taymyr Peninsula.

Contains a comprehensive outline of the relief, stratigraphy (p. 317–63), volcanism (p. 363–81), tectonics, and geological indications of mineral resources; based on post-World War II exploration by the Arktikrazvedka Trust (Glavsevmorput') and the Institute of Geology of the Arctic, the authors participating. Geological structure of the Taymyr folded zone is complicated and not sufficiently explored. Proterozoic and Paleozoic formations are mainly represented. Mesozoic formations, less so. Tertiary is unknown. Quaternary deposits are represented everywhere. Magmatic formations are of large extent. Coal, mica, molybdenum, etc., are possibilities. This area is covered by the geological map at scale 1: 2½ million, which accompanies the volume.

Enlarged from a paper presented to the Linguistic Circle of New York, Nov. 1950, and based chiefly on field work conducted in 1948–1952. Aleut sources of anatomical information (autopsy, comparative anatomy, dry mummification, etc.) and the extent and utilization of their anatomical knowledge are discussed. Their medical practices of acupuncture (based on individual diagnosis), bloodletting, massage (especially in connection with pregnancy), surgery and early ritual custom of dismemberment of slain foes are described. Aleut medical knowledge is compared with that of the Eskimos of southern and western Alaska and the ancient Chinese. The application of anatomical concepts to inanimate objects and the linguistic methods of forming descriptive anatomical terminology are dealt with. Phonological features of the eastern Aleut dialect spoken in Nikolski and Unalaska villages are given and a glossary of approx. 370 anatomical terms with English equivalents and literal translations is appended.

53150. MARSHALL, C. J. North America's Distant Early Warning Line. (Geographical magazine, Apr. 1957. v. 29, no. 12, p. 616–28, 14 illus., text map.)

Building of this 2,500-mile chain of radar stations, extending from Pt. Barrow, Alaska, to the east coast of Baffin Island, is described by the Canadian representative on the DEW Line Site Survey Team in 1955. Work was completed in summers of 1955 and 1956 by 7,000 men at a cost of over $400 million, financed by the U.S. Air Force, the construction and operation handled by civilians. Site surveys, delivery of men and supplies, and actual construction took place in spring 1955. Some 50,000 tons of material were airlifted that year, the bulk of supplies (120,000 tons) was landed by 57 ships and 15,000 men. Some of the problems of aerial supply, and construction under arctic conditions are discussed; also the accessibility of the region, and Eskimo population as affected by these bases. ***Copy seen:*** DLC.

53151. MARSHALL, C. J. Operation Bellot. (Canadian geographical journal, Sept. 1958. v. 57, no. 3, p. 104–111, maps, illus.)

Describes joint Canadian-United States survey, during summer 1957, to determine the existence of a navigable channel through Bellot Strait (71°58′ N. 94°95′ W., north of Boothia Peninsula). A route along the northern mainland coast of Canada through the Strait to Prince Regent Inlet was found practical for deep-draft ships, facilitating the supply of DEW Line sites. A passage through

Barrow and Prince of Wales Straits farther north was proved navigable in 1954 by the HMCS. *Labrador*. Arctic water routes connecting the Atlantic and Pacific are afforded by these two "Northwest" passages. ***Copy seen:*** DGS.

53152. MARSHALL, JEAN M. Effects of low temperatures on transmembrane potentials in isolated auricles of rabbits. (Federation proceedings, Mar. 1957. v. 16, no. 1, pt. 1, p. 84.)

Brief account on transmembrane potentials and auricular contractions at temperatures below 30° C. Conditions were studied in pacemaker cells, in areas close to the pacemaker region and in areas distant from it. ***Copy seen:*** DLC.

53153. MARSHALL, JEAN M. Effects of low temperatures on transmembrane potentials of single fibers of the rabbit atrium. (Circulation research, Nov. 1957. v. 5, no. 6, p. 664–69, illus., table.) 11 refs.

Lowered temperature caused a fall in diastolic and action potentials, and prolongation of the latter in both pacemaker and nonpacemaker fibers. Pacemaker fibers were most resistant to cooling and continued to discharge at temperatures where conducted action potentials and contractions ceased. Acetylcholine administered at this stage elicited action potentials and contractions.

Text in Russian. ***Title tr.:*** Thermocouples for studying soil temperatures under natural conditions.

Measurements made at the Zagorsk Experimental Station of the Institute of Permafrostology are described in detail, and the accuracy of data obtained 1952–1954 is analyzed. Observations to depths of 3–5 m. were supplemented with measurements of soil moisture and temperature and thickness of the snow cover. Frost penetration was studied with the Danilin frost-profile gage, but the ground-thawing heat was insufficient to melt the ice in the gage. Photographic records made simultaneously at 20 thermocouples were used to calculate thermal conductivity and to analyze soil-temperature variations with depth and time. Statistical analysis of all data collected, including those obtained with Lamont thermometers, showed standard deviations of 0.11° C. for individual readings and 0.03° C. for 10-day means.—From SIPRE. ***Copy seen:*** DLC.

mezozoĭskogo progiba. (Leningrad. Vsesoĭuznyĭ geologicheskiĭ institut. Materialy, nov. seriĭa, 1955. vyp. 7, Materialy po geologii Sibirskoĭ platformy, p. 141–47, fold. map.) 10 refs. Text in Russian. ***Title tr.:*** New data on extension of Jurassic deposits within the limits of the Vilyuy-Angara Mesozoic depression.

Presents results of field work with the Tunguska-Lena Expedition in 1950 on the Lower Jurassic transgression and continental and marine deposits in the Chona valley (approx. 61° N. 109° E.) tributary to the Vilyuy. The transgression with NE–SW direction extends further SW than previously recognized, almost to the Chona-Nizhnyaya Tunguska watershed. This changes the geological understanding (also the map) of the region. ***Copy seen:*** DLC.

53171. MASLOVA, G. S., *and* **L. M. SABUROVA.** Étnograficheskoe izuchenie russkogo naseleniia vostochnoĭ Sibiri; predvaritel'noe soobshchenie o rabote étnograficheskikh otriadov Angarskoĭ ékspeditsii AN SSSR v 1957 g. (Sovetskaia étnografiia, 1958, no. 3, p. 154–67, illus., diagrs., fold. map.) Ref. Text in Russian. ***Title tr.:*** Ethnographic study of the Russian population of eastern Siberia; a preliminary report on the work of the ethnographic teams of the Angara expedition of the Academy of Sciences of U.S.S.R. in 1957.

Review by leaders of the ethnographic teams of the Angara archeological expedition of the Institute of the History of Material Culture investigating settlements along the upper and middle Angara and its tributaries. The adaptation to local living conditions by the original, 17th–19th century, colonists (peasants, soldiery) and 19th century settlers (mostly political exiles) and the mutual cultural influence between the Russian and aboriginal Tungus (Evenki) and Buryat population are discussed. The material culture, customs and specific traits of this Siberian civilization are described: agri- and horticulture, animal husbandry, hunting and fishing, arts and crafts, housing (log cabins and outbuildings), clothing, food, religious rites, etc. The uniformity of customs and ways of life among this originally heterogenous population inhabiting both the middle and upper Angara regions is noted. ***Copy seen:*** DLC

53175. MASORO, EDWARD JOSEPH, 1924– , *and others.* Effect of prolonged cold exposure on hepatic lipogenesis. (American journal of physiology, June 1957. v. 189, no. 3, p. 479–82, tables.) 12 refs. *Other authors:* J. M. Felts *and* S. N. Panagos.

A study of the ability of liver slices to convert acetate-I-C^{14} to $C^{14}O_2$ and fatty acid-C^{14}. Slices from cold-exposed rats incorporated much less acetate-I-C^{14} than those from unexposed controls. Carbohydrate metabolism of the tissue showed no differences between cold-exposed rats and controls indicating that depressed lipogenesis in the chilled animals is not associated with reduced carbohydrate metabolism.

Account of investigations made during the British North Greenland Expedition, 1951–1954. Records are presented of dietary intake of four men while sledging or living at the base hut and their energy expenditure. Analysis is made of nitrogen and fat in the feces while sledging; data are given on caloric intake of the huskies and the contribution of human feces to it. No physiological reason was found why huskies prefer human feces to other food. Other animals and birds, it is noted, also eat the feces of other species. ***Copy seen:*** DNLM.

53179. MASTERTON, JOHN POTTER, *and others.* Nutrition and energy expenditure during a polar expedition. (Advancement of science, June 1957. v. 13, no. 53, p. 414–16, tables.) 3 refs. *Other authors:* H. E. Lewis *and* E. M. Widdowson.

Account of investigation on the energy balance of men while sledging (on the British North Greenland Expedition) with energy balance of men living at the base hut used for comparison. Fat utilization by the sledging parties was also studied. Caloric intake of sledging men was found to be 4,770 cal./day against 4,200 cal. offered in earlier expedition. Fat, though high in the diet, was absorbed 96.8 and 96.3%.

53182. MATHEWS, S. T. Investigation into icebreaking. (Canadian shipping, Apr. 1957. v. 28, no. 7, p. 38–41, illus., diagrs.)

Presents, in condensed form, paper read to the Eastern Canadian Section of the Society of Naval Architects and Marine Engineers, describing and analyzing author's experiences abroad an icebreaker of the *Wind*-class in Canadian Arctic Islands waters. Ice conditions are described; the mechanics of icebreaking, and bow and propeller design are discussed. The action of the bow riding up on an ice sheet is analyzed; relative importance of the mass of the ship, its speed, and the associate kinetic energy are shown. Improvements in design features are suggested.

Outlines the main events in Freuchen's life and includes some personal recollections.

Copy seen: DLC.

53184. MATHIASSEN, THERKEL, 1892– . The Sermermiut excavations 1955. København, C. A. Reitzel, 1958. 52 p. illus., diagrs., tables. (Meddelelser om Grønland, bd. 161, nr. 3.) 30 refs.

Deals with author's investigations at Disko Bugt, West Greenland, continuing the excavations of 1953 by J. Meldgaard (cf. No. 52664). Populated during three different periods, separated by sterile layers, the site contains objects (dated by C^{14}) belonging to the Sarqaq (9th–7th century B.C.) and Dorset peoples (1st century A.D.), and Inugsuk Eskimos succeeded by the West Greenlanders (12th–13th century to about 1850). The stratigraphy of the site, the chipped and rubbed stone (angmaq) implements of Sarqaq and stone (micro-blades), bone and wood artifacts of Dorset are described and tabulated. The spread and origin of Sarqaq (linked to Denbigh Flint Complex of Alaska and thence the neolithic and mesolithic of the Old World) and Dorset (favors theory of Canadian Arctic versus Alaska and ties with eastern Indian cultures) are discussed. The local West Greenland variant of the Dorset layer is noted.

Account of experiments with hypothermic dogs subjected to caval occlusion

and to K-induced cardiac arrest; in six cases ventricular fibrillation was also present. Resuscitation by means of cardiac massage with intravenous glucose and insulin led to recovery of sinus rhythm and a normal ECG. Three animals died, one as a result of K-overdose. ***Copy seen:*** DNLM.

53192. MAVROUDIS, ANTHONY N. Heated aggregates for concrete keep winter paving spread moving. (Contractors and engineers, Oct. 1957. v. 54, no. 10, p. 30–33, illus.)

A boiler was used for live-steam heating of the aggregates in the bins and stockpiles on a road construction project at Hamburg, Pa. A six-in. subbase of crushed slag was protected against frost by a covering of straw between curing papers, used also to cure the concrete. An eight-in. layer of concrete at 60–100° F. was placed on the subbase, a wire mesh was positioned over the lift, and two in. of concrete upon that. Both pavers used had equipment for heating the water before mixing into the concrete batch. As added precaution against freezing a solution of 100 lb. calcium chloride: 25 gal. water was mixed into each concrete batch in the paver skip.

Naukan and Uelen; Uelen school; bone carvers; visit to the village of Lorino; acculturation of the Chukchis and improvement in their living conditions, new houses replacing the old "yarangas," etc. ***Copy seen:*** DLC.

53203. MEEK, JACK H. Polar disturbances. (*In:* Polar Atmosphere Symposium, *Oslo*, 1956. v. 2, *pub.* 1957, p. 120–28, maps, graphs.)

Status of ionospheric prediction is characterized and research of the last 25 years relative to the problem of polar geomagnetic disturbances reviewed. Variations in the critical frequency of F 2-layer with time and positional variations in northern regions are described, and their relation to magnetic disturbances is discussed. ***Copy seen:*** DLC.

53204. MEEK, JACK H. Prediction techniques at high latitudes. (Polar Atmosphere Symposium, Oslo, 1956. v. 2, *pub.* 1957. p. 101–107, graphs.)

A method of HF predictions developed in Canada by J. C. W. Scott, similar to existing methods and adapted to polar communication problems, is presented in detail. As with other methods, the system is based empirically on a linear relationship between the critical frequency and the sunspot number; its success thus depends on ability to estimate the sunspot number. An important limitation of this polar prediction system is that predictions are made for quieter periods whereas the ionosphere is often disturbed.

53205. MEEN, VICTOR BEN, 1910– . Chubb Crater, a meteor crater. (Royal Astronomical Society of Canada. Journal, Apr. 1957. v. 51, no. 2, p. 137–54, illus., diagrs., graphs, tables.) 8 refs.

Account of field observations of the (now-called) Ungava Crater (61°17′ N. 73°40′ W.) and adjacent areas about 61 mi. southeast of Wakeham Bay on Hudson Strait. Rocks of apparent Precambrian age underlie the region; bedrock near the crater is an almost white granite; the rim consists of granite, with a sprinkling of fragments on top and on the slopes. The area has been glaciated; the surface is almost completely boulder-covered; boulders are rough near the crater, rounded elsewhere. A generalized map, scale 1 in.=3 mi., indicates geologic and topographic features. Greatest depth measured was 825 ft., and rim-to-rim dimensions of the slightly elliptical crater are 11,500 by 11,000 ft. Limnological observations on Ungava Crater Lake and neighboring lakes are given in tabular summary. J. A. C. Keefe's survey of vertical magnetic intensity near the crater July–Aug. 1951, is reported (p. 148–54) by Keefe, S. H. Ward and J. T. Wilson, with graphs of magnetic profiles and contours. Sparse field observations suggest the presence of several zones of anomalous intensity, (see map). Rough estimates of the types of body causing the anomaly indicate presence of magnetite-bearing bands or dikes, believed to be of non-meteoritic origin. No meteoritic fragments were found, but from other evidence, the crater is concluded to have been produced by the explosion of a meteor, probably toward the end of the ice age. ***Copy seen:*** DLC.

53206. MEEN, VICTOR BEN, 1910– . Merewether crater, a possible meteor crater. (Geological Association of Canada. Proceedings, Dec. 1957, v. 9, p. 49–67, illus., 5 sketch maps, 4 tables.) 9 refs.

Meteoric origin of this crater, 58°02′ N. 64°02′ W., about 12 mi. east of the Quebec-Labrador boundary, is suggested after study of the area carried out July 23–Aug. 19, 1954. Evidence favors such origin: extreme symmetry, great depth, character of rim, excellent agreement with Baldwin's law for explosion craters; evidence is lacking for other origin, such as glaciation, solution of underlying bedrock, or vulcanism. Study of this crater started from an air photo taken by Col. Arthur F. Merewether, U.S. Army Air Force, in 1943. Its similarity in appearance to the Ungava, formerly Chubb Crater (No. 36170) is noted in support of meteoric origin. ***Copy seen:*** DGS.

Geophysics. Association of Scientific Hydrology. Report 1957. v. 4, *pub.* 1958, p. 500–508, diagrs., tables.) 9 refs.

Discusses problem of glacier flow and fracture patterns, based on studies of crevasses on Saskatchewan Glacier in Canada and on the Greenland icecap. Preliminary results suggest that crevasses form when the maximum principal strain rate exceeds 0.01 $yr.^{-1}$; they form at a slight angle to trajectories of that strain rate, and shearing displacements occur across crevasse walls. Initiation of crevasses, their opening and extension rates are discussed and data given to allow prediction of velocity in areas where direct measurement is impossible.—From SIPRE.

53215. MEIER, MARK F., *and others.* Preliminary study of crevasse formation, Blue Ice Valley, Greenland, 1955. Wilmette, Ill., July 1957. 80 p. illus., diagrs., maps, tables. (*In:* U.S. Army. Corps of Engineers. Greenland ice cap research program, 1955–1956, v. 1. SIPRE report 38.) 56 refs. *Other authors:* J. E. Conel, J. A. Hoerni, W. G. Melbourne, C. J. Pings, Jr., *and* P. T. Walker.

A quantitative study of some aspects of the geometry, mechanics, and thermodynamics of crevassing made June 26–Aug. 25, 1955, on the icecap east of Thule. Topography, meteorology, accumulation and ablation, and stratigraphy of the firn in the study area, are outlined, followed by description of the shape and structure of the crevasses; discussion of deformation measurements; comments on stress- and strain-rate environments; statement of a trial theory for the formation of a simple crevasse pattern, based on the fundamental criterion for crevasse formation: viz., a critical value of surface extension. Temperature measurements were made upon the ice body adjacent to a selected crevasse, by a total of 61 thermocouples. Conclusions summarize results of study and recommend further work; 17 tables summarize observations.

53216. MEĬLAKH, I. G. K voprosu o proniknovenii vod Severnogo Ledovitogo okeana v Beringovo more. (Problemy Arktiki, sbornik stateĭ, 1958. vyp. 3, p. 35–40, diagrs.) 3 refs. Text in Russian. ***Title tr.:*** Penetration of the Arctic Basin waters into the Bering Sea.

In general, the currents of Bering Strait are dominated by the strong flow of Pacific waters into the Arctic Basin. A weak arctic-water current, however, is said to be noticed sometimes near the Chukotka coast of the Bering Sea, and analysis of temperature and salinity data in Provideniya Bay at 64°27′.7 N. 173°15′.3 W. in 1954–55 supported that claim. The flow of arctic waters into the Pacific, caused chiefly by north and northwest winds, attains its maximum in Sept.–Nov., and in some years masses of cold lower-salinity water from the Chukchi and even from East Siberian Sea, reach Provideniya Bay. Possibility of such a current must be taken into account in forecasting ice conditions in the northwestern part of the Bering Sea.

Meteorologiska och hydrologiska institutet. Meddelanden, ser. D, nr. 1.) Text in Swedish. Summary in English. ***Title tr.:*** Investigations of the Meteorological and Hydrological Institute of Sweden concerning ice conditions in water courses.

The effects of regulation works on the flow of water during the winter in northern Sweden are discussed, with emphasis on problems related to the lakes. The increased flow during winter

releases the heat storage at lower levels which is normally insulated from the top by the subjacent water layer. This retards the formation of ice in the winter, weakens the ice cover, and accelerates spring breakup. Traffic over the ice may be impeded by the regulated flow. Water power developments have greatly improved the ice conditions above the waterpower plants because many rapids with no or poor ice have been converted into lake-like ponds favorable to the formation of even and durable ice sheets.

Discusses the substantival and attributive-predicative meanings of Eskimo nouns with the possessive suffix "lik".

Copy seen: DLC.

53233. MENOVSHCHIKOV, GEORGIĬ ALEKSEEVICH. Iz istorii obrazovaniiâ chislitel'nykh v èskimosskom iâzyke. (Voprosy iâzykoznaniiâ, July–Aug. 1956. god 5, no. 4, p. 60–71.) 10 refs. Text in Russian. ***Title tr.:*** On the formation of numerals in the Eskimo language.

Gives an etymological analysis of the origin, formation and dialectal development of Eskimo numerals. The morphological and linguistic similarities between the cardinal numbers, based on the quinary (five-count) system, of the Western and Asiatic Eskimo languages attest to their formation in a common primigenial tongue; the differences are result of dialectal development after their territorial dispersion. A very early Aleut-Eskimo separation is suggested and certain structural affinities noted between the Eskimo and Chukchi-Koryak languages. ***Copy seen:*** DLC.

(Razvedka i okhrana nedr, Apr. 1957. god 23, no. 4, p. 42–49, table, graphs, diagr.) 5 refs. Text in Russian. ***Title tr.:*** Experimental use of geophysical methods of survey in searching for kimberlite pipes.

Geophysical work in locating deposits is discussed in relation to diamond pipes in the "Zarnitsa" and "Mir" deposits of Yakutia. Physical properties of rocks, especially kimberlites, served as basis for selection and evaluation of geophysical methods. Magnetic properties of kimberlite differ from those of the surrounding

511326—60——49

limestone, dolomites, etc. The rocks of a trap formation have magnetic properties of fluctuating intensity. Tufaceous rocks create a distinct magnetic anomaly. Aeromagnetic survey costs are approx. 1/35 that of surface work in the terrain conditions of Yakutia. Results of work at 100–600 m. altitudes are diagrammed (p. 44). Aeromagnetic survey of seven kimberlite pipe deposits is described with reference to intensity of magnetic effects and efficiency of the method. Gravimeters, gravitational variometers or gradiometers of high sensitivity are generally used for observation of magnetic anomalies of kimberlite pipes. For determination of the pipe deposit contour from aircraft in the permafrost region, additional experiments are required in use of the induction method.

53236. MENZIES, ROBERT JAMES, 1923– . The marine borer family Limnoriidae: Crustaceae, Isopoda. (Bulletin of marine science of the Gulf and Caribbean, June 1957. v. 7, no. 2, p. 101–200, 42 illus.) 109 refs. *Pub. also as:* Contribution from; The Pacific Marine Station, Dillon Beach, Marin County, California; the Zoology Dept., Univ. of Southern California and the Scripps Institution of Oceanography, new ser. 931, and the Lamont Geological Observatory, no. 239; Biology program no. 15.

Contains a systematic and zoogeographic account of the wood- and seaweed-boring marine isopods of North and Central America. A brief review of the literature: taxonomic, distributional, ecologic, physiologic and anatomical studies, is included. The general morphology of *Limnoria* and its systematic characteristics are outlined. The family Limnoriidae is reestablished, with keys and diagnoses to 22 species, nine of which are described as new. Only one species, *Limnoria lignorum*, has a typical boreal distribution (Tromsø, northern Norway; Komandorskiye Islands; Adak in the Aleutians, and Sitka). Variations in salinity, temperature, dissolved oxygen, and food supply are considered the major factors influencing the distribution of the species. ***Copy seen:*** DLC.

Contains an historical review, data on morphology, geographic distribution, classification and economic importance of this perennial herb. A generic description, keys to the series and species are followed by an annotated list of 31 species, 11 subspecies and seven varieties, several described as new, and extensive lists of specimens provided. *V. s.* ssp. *sitchensis* from Sitka, Alaska, and *V. c.* ssp. *capitata* from Alaska and northern Canada are included. ***Copy seen:*** DA.

53255. MEYER, G. E., *and others.* A versatile new family of elastomers. (Rubber world, July, Aug. 1957. v. 136, no. 4, 5, p. 529–36, 695–701, graphs, tables.) 33 refs. *Other authors:* W. E. Gibbs, F. J. Naples, R. M. Pierson, W. M. Saltman, R. W. Schrock, L. B. Tewksbury, *and* G. S. Trick.

New specialty rubbers were prepared by free radical addition of aliphatic mercaptans to the double bonds of diene polymers. By varying the nature of the base polymer, the mercaptan, and the extent of saturation, a wide range of compositions and physical properties was attained in the adducts. Preparation of solvent resistant polymers with improved low temperature flex properties is graphed (p. 696). Low temperature stiffening and embrittlement of adduct elastomers as a function of the extent of saturation and chain length of mercaptan, are examined and graphed (p. 695).

53263. MICHAEL, HENRY N. The neolithic age in eastern Siberia. Philadelphia, Apr. 1958. 108 p. illus., tables, maps. (American Philosophical Society. Transactions, new ser. v. 48, pt. 2.) 165 refs.

A concise and exhaustive survey of the major neolithic finds in eastern Siberia (except the Soviet Far East), based mainly on A. P. Okladnikov's excavations in the Lake Baykal area, the middle and lower Lena valley and the arctic littoral between the Khatanga and Kolyma Rivers. The stone, bone and bronze artifacts, sculptures, skeletal remains, etc., of these three regions are described in chronological order from the late paleolithic to the early iron age, with particular stress on the Isakovo, Serovo and Kitoy periods (4th–2nd millennium B.C.). The main burial and habitation sites are correlated and mapped. The differences and affinities between the Lena-arctic coast and Lake Baykal finds are analyzed and the existence in neolithic times of two distinct culture areas, north and south of present-day Yakutsk, indicated. The connections between the Paleo-Eskimo cultures and the east Siberian neolithic are outlined, the significant finds in northern North America reviewed and the problems of chronological synchronization noted.

MICHAELSON, NEIL E., *see* Alaskan Science Conference, 1954. Science . . . proceedings. *1957.* No. 49210.

53264. MICHÉA, JEAN P. L'art Esquimau. (Géographia, Mar. 1958. no. 78, p. 34–40, 9 illus.) Text in French. ***Title tr.:*** Eskimo art.

Discussion of Eskimo culture with consideration of the Eskimo's awareness of natural surroundings, spiritual values, his materialist concept of life, understanding of "Sila" (the universe), his artistic expression in functional and decorative objects, in songs and dances, etc. Legends form an important part of his life. His sense of humor and self-respect are basic attributes.

Copy seen: DGS.

53265. MICHÉA, JEAN P. L'iglou. (Géographia, Dec. 1957. no. 75, p. 53–60, illus., diagrs.) Text in French. ***Title tr.:*** The igloo.

Discusses the construction technique of the Canadian Eskimo snow house, its furnishings, lighting and heating, insulation, etc. The emergency shelter and the house with entrance passage and porch, wooden door and storage anteroom (floor plan and profile given), also the complex of several dwellings with a common entrance passage are described. The kragmar or kraggak (community hall) and the kangmak (snowhouse topped by tent, used during the spring melt) are sketched in turn. Also noted are the semi-subterranean, rectangular, stone-reinforced, wooden house used in Greenland (except Smith Sound region), Alaska and the Mackenzie delta area; the circular hut of the Bering coast, and the ancient "tounit" made of whale bones and covered with skins and earth. The comparatively recent derivation of the snow house from the circular, snow-reinforced hut is suggested. ***Copy seen:*** DGS.

53266. MICHÉA, JEAN P. Petrolio sotto il Mackenzie. (Vie del mondo, July 1958. anno 20, no. 7, p. 719–28, illus., map.) Text in Italian. ***Title tr.:*** Oil beneath the Mackenzie.

Sketches the economic resources of the Mackenzie Basin and describes oil production at Norman Wells. Operating at full capacity ten months a year, 24 hrs. a day, the wells yield currently 1,300 bbls./day. Operational difficulties arise from the subarctic climatic conditions: the permafrost layer approx. 50 m. deep, ice on the Mackenzie River impeding the use of floating derricks, flooding of wells during the spring break-up, etc. Operation Canol and record oil production during World II, construction and abandonment of the (Canol) pipe line to Whitehorse and Skagway refineries, etc., are mentioned. The area's technological development has affected adversely the native hunting economy of the Hare Indians; their economic crisis, Canadian Government and other relief activities, the difficulties of recruiting them as labor at industrial sites (involving abandonment or relocation of families) and the planned training of a skilled labor force are discussed. The Norman Wells area is considered typical for social problems concomitant to development of the far North. ***Copy seen:*** DLC.

53267. MICHÉA, JEAN P. Les ruses de chasse chez les Esquimaux. (Géographia, Nov. 1957. no. 74, p. 7–12, illus.) Text in French. ***Title tr.:*** Hunting tricks of the Eskimos.

Describes various ruses and lures used in seal, caribou and fox hunting, usually to rouse the animal's native curiosity: agitating bits of bone from the harpoon point under water, singing, knocking lightly on the kayak bottom, etc. to attract the animal. Use of salt and urine to attract caribou, and of cairns and corrals to lead them into shooting range, use of baited traps for fox hunting, etc., are described. ***Copy seen:*** DGS.

53268. MICHELSSON, BERTEL E. KaMeWa-propellern. (Tekniska föreningen i Finland. Förhandlingar, June 1950. årg. 70, nr. 6, p. 93–98, illus., diagr., graphs.) Text in Swedish. ***Title tr.:*** The KaMeWa propeller.

Describes the propeller (made by Karlstads Mekaniska Werkstad, Sweden), stressing its value where great maneuverability is required, e.g. in ice-breakers. Two Finnish ice-breaking harbor tugs, the *Porin Karhu* and the *Aura*, are equipped with this controllable pitch propeller. ***Copy seen:*** DLC.

53269. MICK, ALLAN H. Arctic and subarctic agriculture. (Biology Colloquium, 18th, 1957. p. 100–109, illus., tables.) 26 refs.

Discusses food production potential in Alaska: acreage, demand, climate and growing season characteristics, the subarctic photoperiod, and soil resources. In terms of land, Alaska can expect to develop ¼ to ½ of the overall acreage needs of the population, but farm development is slow. Long hours of daylight available for photosynthesis causes rapid growth with less physiological aging of vegetables, but raises problems of premature blooming and break-down of winter-hardening mechanisms. Effects of variations in light quality caused by differences in angle of incidence of solar rays are under study, and plant strains not sensitive to long-day length and tolerant of variations in light quality are being sought. Most Alaskan crop production occurs on subarctic brown forest soils (described) which contain high potash levels but are deficient in organic matter and nitrogen, necessitating fertilizer applications. In some places, permafrost inhibits cultivation of otherwise good lands. ***Copy seen:*** DGS.

The nearctic species belonging to these genera are studied in an attempt to clarify taxonomic difficulties. The introductory part (p. 51–70) includes an historical review, external morphology and terminology, phylogeny and geographical distribution, bionomics, and classification. The special part contains a systematic arrangement (p. 70–160) with keys (male and female), synonyms, descriptions of 11 new species and redescriptions of 37 recognized species.

with life history notes, hosts and distributional records. Five of the species are native to Alaska and northern Canada. ***Copy seen:*** DLC.

53293. MILLER, DON JOHN, 1919– . Anomalous glacial history of the northeastern Gulf of Alaska region. (Geological Society of America. Bulletin, Dec. 1958. v. 69, no. 12, pt. 2, p. 1613–14.) Abstract of a paper presented at the Society meeting in St. Louis, Nov. 6–8, 1958.

Relates the area's glaciation anomalies to tectonic activity: vigorous glaciation beginning by early Pliocene, possible middle Miocene time; mild glaciation during late Wisconsin; and Post-Wis-

consin advance of individual glaciers as far as 35 mi. beyond present ice fronts.
Copy seen: DGS.

53294. MILLER, DON JOHN, 1919– . Geology of possible petroleum provinces in Alaska. Washington, D.C., 1957. 239 p. 7 plates, 3 index maps, 6 tables. Mimeographed. (U.S. Geological Survey. Reports, open file series, no. 421.) 103 refs. *Other authors:* T. G. Payne, G. Gryc, E. H. Cobb, J. T. Dutro, Jr.

Contains discussion of the geology of Alaska as related to known and potential occurrences of petroleum, and review of petroleum exploration. Maps (prepared by T. G. Payne and J. T. Dutro, Jr.) show major tectonic elements and provinces in which geologic conditions may be favorable for commercially significant accumulations of petroleum, also locations of indications of petroleum, and test wells. Three general regions are identified: southern, 185,000 sq. mi., discussed by D. J. Miller; central, 275,000 sq. mi., by T. G. Payne; northern, 125,000 sq. mi., by G. Gryc. Sources of geologic information are listed by regions; an annotated bibliography of 109 U.S. Geological Survey reports through 1955, prepared by E. H. Cobb, is given. Appraisal of oil and gas resources based on the geology of tectonic elements is provided for each region, including known deposits. Mention is made of the Katalla field in the Gulf of Alaska province, until 1955 the only commercial producer in Alaska (154,000 bbl., 1902–1933). Known deposits and possible sources in the central region are limited. Possible sources in the northern region, especially in U.S. Naval Petroleum Reserve No. 4, have been more carefully investigated; geologic conditions favorable for oil and gas accumulations prevail in about half the area; estimated total reserves range from 30 to 100 million barrels of oil, and 370 to 900 billion cu. ft. of gas.
Copy seen: DGS.

53295. MILLER, DON JOHN, 1919– . The surface velocity of the Yakataga Glacier, Alaska. (Journal of glaciology, Oct. 1957. v. 3, no. 22, p. 124–30, 3 illus., 2 text maps, profiles, 2 tables.) 2 refs.

Main trunk of this glacier (60°10′ N. 142°08′ W.) descends from 1130 to 150 m. in a distance of 21 km. "A rock fall at the head of the glacier formed a moraine of distinctive shape which advanced at an average rate of 114 m./yr. from 1938 to 1954. The surface velocity of the glacier at 15 stations below the firn line was calculated from the displacement of the rock-fall moraine and other less conspicuous features . . . shown in two sets of vertical aerial photographs taken in 1948 and 1954." Average surface velocity along a medial line of the glacier ranged from about 90 m./yr. at 14 km. above the terminus to zero at 2.3 km. This technique of photogrammetric measurement of surface velocity is well suited to Alaska where many glaciers have been photographed from the air after intervals of a few years to as many as 30 yrs.—From author's abstract.

53300. MILLER, MAYNARD MALCOLM, 1921– . Mass movement and stress relation in the Taku Glacier, Alaska. (Geological Society of America. Bulletin, Dec. 1957. v. 68, no. 12, pt. 2, p. 1768–69.)

Abstracts paper presented at the Society meeting in Atlantic City, Nov. 1–3, 1957. Describes studies of the glacier's movements, and flow data indicating a composite stressing condition probably related to its advance since the 1890's.

Copy seen: DGS.

53301. MILLER, MAYNARD MALCOLM, 1921– . Phenomena associated with the deformation of a glacier borehole. (*In:* International Union of Geodesy and Geophysics. Association of Scientific Hydrology. Report 1957. v. 4 *pub.* 1958, p. 437–52, illus., diagrs., tables.) 17 refs.

Stress strain analysis of the deformation of a two-in. (I.D.), 245-ft. length of jointed aluminum tubing inserted in a vertical bore-hole in the Taku Glacier, Juneau Ice field, Alaska; based on three years' data. Results are related to flow equations derived from laboratory tests, and compared with bore-hole and tunnel experiments conducted in glaciers in the Alps and Norway. Observed thermal anomalies appear to coincide with deformation anomalies. ***Copy seen:*** DGS.

53302. MILLER, MAYNARD MALCOLM, 1921– . The role of diastrophism in the regimen of glaciers in the St. Elias district, Alaska. (Journal of glaciology, Oct. 1958, v. 3, no. 24, p. 293–97, sketch maps.) 12 refs.

The effect of climate on glacier fluctuations in the district (approx. 60° N. 140° W.) is reassessed on the basis of new evidence from adjacent regions and of a review of records of excessive precipitation along the coast in the latter 1870's–1880's. Precipitation and temperature trends 1876–1902 in Southeast Alaska, global statistics, and the regional pattern of glacier fluctuations (where no earth tremors were reported) were examined. Advances of glaciers in the Yakutat area about the turn of the century were conditioned fundamentally by meteorological causes, it is suggested, earthquakes being a supplemental and generally minor factor.—From SIPRE.

53304. MILLER, ROBERT DAVID, 1922– , *and* E. DOBROVOLNY. Origin of the Pt. Campbell-Pt. Woronzof area as related to the "blue clay" that underlies Anchorage, Alaska. (Geological Society of America. Bulletin, Dec. 1957. v. 68, no. 12, pt. 2, p. 1907–08.)

Abstracts a paper presented at the Eighth Alaskan Science Conference in Anchorage, Sept. 10–13, 1957. A theory is offered on the common glacial origin of the blue-gray silty clay underlying Anchorage and stratified deposits forming ridges extending from Pt. Campbell on Turnagain Arm of Cook Inlet to Pt. Woronzof on Knik Arm. The ridge deposits probably originated as a delta built northward from an ice-dammed lake formed by a glacier advancing from the northwest or west; the finer-grained material from this glacier is thought to have been deposited in the lake forming the clay. ***Copy seen:*** DGS.

53305. MILLER, ROBERT DAVID, 1922– , *and* E. DOBROVOLNY. Pleistocene history of the Anchorage area, Alaska. (Geological Society of America. Bulletin, Dec. 1957. v. 68, no. 12, pt. 2, p. 1908.)

Abstracts a paper presented at the Eighth Alaskan Science Conference in Anchorage, Sept. 10–13, 1957. Describes glaciation sequences indicated by exposed drift: the earliest, of probable Illinoian age; Knik, of probable post-Sangamon but pre-Wisconsin age; Naptowne, of early Wisconsin age; and a later Wisconsin advance. A peat deposit correlated with interglacial weathering on the "blue clay" which accumulated during the Knik glaciation is dated at older than 38,000 radiocarbon years, and outwash deposited during the last Wisconsin at 11,600 ±300 radiocarbon years. Channels cut into the outwash and "blue clay" by erosion from waters of Matanuska and Knik Rivers and encroaching Cook Inlet waters became Knik and Turnagain Arms of the Inlet. ***Copy seen:*** DGS.

Detailed study of the Ungava (formerly Chubb) Crater, based on examination of RCAF air-photo coverage in 1953, reports and maps. The center of the lake is at approx. 61°17′ N. 73°41′ W.; water depth is 825 ft.; elevation of lake surface is 1,700 ft. Detailed profile measurements along 16 equally spaced radii originating from a selected center are tabulated, shown graphically, and discussed in text. The crater agrees well with the standard form of explosion craters of comparable size, and is probably of meteoric origin.

53335. MITCHELL, HAROLD HANSON, 1886– . Laboratory studies. (*In:* Nutrition under climatic stress, a symposium sponsored by the U.S. Quartermaster Food and Container Institute. Washington, Dec. 1952, *pub.* 1954. p. 108–129, illus., tables.) 46 refs.

The section on nutrition in cold environment (p. 109–123) deals with energy requirements and the elements of this increased demand; dietary effect on cold resistance, and on performance; effect of high-carbohydrate versus high-fat diet in cold-tolerance; diet and shivering; the role of vitamins. ***Copy seen:*** DNLM.

53336. MITCHELL, HAROLD HANSON, 1886– , *and* M. EDMAN. Nutrition and resistance to climatic stress, with particular reference to man. Chicago, 1949. 3, 112 p. tables. (U.S. Quartermaster Food and Container Institute for the Armed Forces. Research reports.) About 700 refs. Rev. ed.: No. 30834.

Comprehensive review of the effects of climate upon nutrition and the role of diet in resistance to climatic stress. Its first part (p. 3–16) deals with diet in cold environment, viz. the physiological effects of cold (cold-stimulus to metabolism, tolerable low temperature, sweat

secretion, evacuation, pathology of cold); effect of cold on nutrient requirements; animal and human experiments; effects of diet on cold-tolerance as established in animal and human experiments; thermal balance in man as affected by specific dynamic influence of food. Subsequent sections deal with diet in hot climate and at high altitude. ***Copy seen:*** DNLM.

53337. MITCHELL, JOHN MURRAY, 1928– . The feasibility of artificial fog dispersal in Alaska. Washington, D.C., U.S. Weather Bureau, July 2, 1957. 48 p. 9 diagrs., 12 tables. 22 refs.

Preliminary report: climatological analysis of characteristics of fog and ice fog at Elmendorf, Eielson, and Ladd Air Force Bases; brief general survey of fog dispersal methods; selection of "best method" of fog dispersal at each base. At Elmendorf, evidence indicates that nearly all winter fogs may be dispersed at the runway by ground seeding with dry ice or silver iodide smoke. At Eielson and Ladd, conditions of wind and stability during ice fog often favor dispersal by means of horizontal axis fans to ventilate the runway.

53338. MITCHELL, JOHN MURRAY, 1928– . Visual range in the polar regions with particular reference to the Alaskan Arctic. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 1, pub. 1958. p. 195–211, illus., diagrs.) 14 refs.

Principal factors determining visual range in the polar atmosphere are discussed briefly, and the phenomena of arctic haze and ice fog are described in detail. Principal emphasis is placed on ice fog, primarily man-produced, and one of the chief operational problems at many arctic, particularly Alaskan, air bases. The causes of ice fog, frequency, and visual range in ice fog are discussed. Dense arctic sea smoke along tidal flats in the colder season is also considered. Possible remedial measures are outlined for ice fog and sea smoke.

53339. MITCHELL, JOHN MURRAY, 1928– . The weather and climate of Alaska. (Weatherwise, Oct. 1958. v. 11, no. 5, p. 151–60, 6 text maps, graph, 2 tables.)

Non-technical description, emphasizing contrasts of geography, topography, and weather. Three broad climatic zones are suggested: southeastern and southern; interior; western and northern Alaska including the Aleutians. Each zone's climate is described in turn, with mention of such phenomena as local mountain winds at Fort Greely, steam fog at Anchorage, ice fog at Fairbanks, and extreme effects of blowing snow along the Arctic Slope. The aurora is regularly observed; "looming" of distant objects occurs, as does the "whiteout."

53343. MLADOVA, T. A. Vliĭanie ponizhennoĭ temperatury na ammonifitsiruiushchuiu mikrofloru dernovo-lesnykh pochv Iakutii. (Akademiĭa nauk SSSR. Sibirskoe otdelenie. Izvestiĭa, 1958, no. 9, p. 100–108, tables.) 14 refs. Text in Russian. ***Title tr.:*** Influence of reduced temperature on the ammonifying micro-flora of turf-forest soils in Yakutia.

Reports results of laboratory studies at the Academy of Sciences' Yakut Branch. Soil samples from Yakutsk District, with 30 and 50% moisture content were kept at +28° and +5° C. for periods up to 45 and 75 days, and bacteria counts were made. Development of ammonifying (*Pseudomonas*, *Mycobacterium*, etc.) and spore-forming (*Bac. mycoides*, *Bac. cereus*, *Bac. megatherium*, etc.) bacteria was negatively affected by reduced temperature, while increase of moisture had positive effect on growth of bacteria at +28° and did not affect growth at +5° C. Conclusion is reached that reduced temperature slows down the process of decomposition and synthesis in the soil. ***Copy seen:*** DLC.

53344. MO, RAGNVALD, 1898– . Dalbygg og utfjerding; folkeminne frå Salten, 4. Oslo, 1957. 145 p. (Norsk folkeminnelag. Skrifter, 79.) Text in Norwegian. ***Title tr.:*** Valley settlements and equipment; folklore from Salten, 4.

Describes the living conditions and facilities, customs and occupations in Nordland province, northern Norway, as recalled from memory or written records. In the 18th–19th centuries, the region was largely self-sufficient, agriculture and fishing were the main occupations, life was hard, hunger common, and conditions were worse among the Lapps who were considered inferior. Superstitions and beliefs, medical practices and standards of conduct, home and community life, etc. are recounted. ***Copy seen:*** DLC.

53345. MO OCH DOMSJÖ AKTIEBOLAG. Sweden's forest bounty; a book about Mo och Domsjö aktiebolag. Stockholm, 1946. 102 p. illus. diagr., map.

History and present activities of this lumber company which owns large forest areas in Norrland northeast from Lycksele (64°35′ N. 18°40′ E.) and Åsele (64°10′ N. 17°10′ E.) to the coast. The company originally exploited its virgin forests, but later turned to forest development and management, and is a pioneer and leader in the reforestation and forest cultivation program now under way in Norrland. It produces sawed lumber, wallboard, sulphite and sulphate wood pulp, mechanical pulp, woodworking materials and chemical products. Its mills, etc. are located on the coast.

53373. MOOR, GEORGIĬ GEORGIEVICH, 1907–1958. Kimberlitopodobnye porody s ksenolitami gneĭsov arkheĭa iz severnoĭ okrainy Sibirskoĭ platformy. (Akademiĭa nauk SSSR. Doklady. Aug. 21, 1957. god 25, t. 115, no. 6, p. 1173–76.) Text in Russian. ***Title tr.:*** Kimberlite-like rocks with xenoliths of Archean gneisses from the northern edges of the Siberian platform.

Describes veins of alnoite-like rocks with content of xenolite hypersthene

gneisses and anorthosites of Archean age, found between the mouths of Kindyn and Potokuy Rivers and near the mouth of the Ėgelyakh—all tributaries of the lower Kotuy (approx. 68° N. 102° E.). The formation, structure, types and mineral composition of these veins are described. Characteristics of xenolite, pyroxene, phlogopite, hypersthene, gabbro-diorite, and nephelite are given. Occurrence of melilite basalts is reported considered, by chemical composition, most closely associated with kimberlites. Discovery of kimberlite itself is anticipated. ***Copy seen:*** DLC.

53374. MOOR, GEORGIĬ GEORGIEVICH, 1907–1958. O nakhozhdenii lovchorrita na severnoĭ okraine Sibirskoĭ platformy. (Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Informat͡sionnyĭ bŭlleten', 1957. vyp. 6, p. 29–32, tables.) 2 refs. Text in Russian. ***Title tr.:*** The discovery of lovchorrite in the northern border region of the Siberian platform.

Describes briefly rare earth minerals found in syenite veins in the Odikhincha massif in the lower Kotuy basin (approx. 70° N. 102° E.). Mineral composition of melanocratic syenites is characterized. Chemical analyses of the Odikhincha massif lovchorrite are compared with those from the Khibiny massif where lovchorrite was first discovered. Components of other rare elements are given. ***Copy seen:*** DGS.

53375. MOOR, GEORGIĬ GEORGIEVICH, 1907–1958. O pektolite iz intruzivnogo massiva Odikhincha nizhnego techeniĭa reki Kotuĭa. (Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Informat͡sionnyĭ bŭlleten', 1958. vyp. 10, p. 16–19, tables.) 4 refs. Text in Russian. ***Title tr.:*** Pectolite from the Odikhincha intrusive massif in the lower course of the Kotuy River.

This relatively rare mineral was found by the author in 1955 in melanocratic syenite veins of the Odikhincha alkali massif (approx. 70° N.) in Krasnoyarskiy Kray. Pectolite, a hydrosilicate of calcium and sodium of the wollastonite group, is described. Chemical analyses are presented, optical constants indicated. Comparison is made with pectolites of the Khibiny massif and north Caucasus. ***Copy seen:*** DGS.

53383. MOORE, R. C. Forecasting of disturbed HF communication conditions. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 2, *pub.* 1957, p. 147–56, map, graphs.)

"The National Bureau of Standards operates forecasting centers at Fort Belvoir, Va. and Anchorage, Alaska for the North Atlantic and North Pacific radio paths, respectively. Four types of forecast are issued: long term for periods 1–7 and 8–25 days later; medium term for the next 24 hrs.; and short term for the next 6 hrs. (Fort Belvoir) or 9 hrs. (Anchorage). Predictions are based on the 27-day recurrence tendency in solar-terrestrial effects, ionospheric responses to specific types of solar activity, the normal persistence tendency of ionospheric conditions, and detailed knowledge of current geomagnetic, ionospheric, and radio transmission conditions. Geomagnetic responses to solar phenomena are discussed in some detail."—Author's abstract. ***Copy seen:*** DLC.

53384. MOORE, R. K. Aurora and magnetic storms; the nature of ionospheric disturbances and their effect on radio communication. (QST, June 1951. v. 35, no. 6, p. 14–19, +, illus., graphs.) 14 refs.

Describes the influence of geomagnetic storms on wire- and wireless communica-

tions, with a special view to amateur long-distance communications in the 50 and 144-mc bands. Various types of auroras are described briefly: yearly average number and monthly variations at given latitudes 52°–60° N. are graphed, and the best time to establish long-distance "auroral" communications, is indicated.

53385. MOORE, TERRIS, 1908– . The arctic pilot. (*In:* N. D. van Sickle. Modern airmanship. New York, 1957. p. 748–96, illus.) 6 refs.

Preparatory and in-flight precautions and procedures are outlined, with special attention to landing and take-off outside regular airports and airstrips. Modification and preparation of an aircraft for arctic use are described; cabin heating and windshield defrosting are important, as are reduction of engine cooling, and heating of the carburetor air intake. Where heated hangars are unavailable, aircraft must be parked so that the landing gear does not freeze to the ground; engine and oil must be preheated to a safe extent before starting is attempted. Other precautions are noted, e.g. tying down parked aircraft, preparation of snow runways, removal of ice on wings, elevators, stabilizers, and ailerons. Special in-flight problems created by extreme cold, ice fog, white-out, and carburetor icing are discussed, and emergency measures to reduce their effects are indicated. Directions for landing and take-off on river bars, beaches, tidal flats, roads, frozen lakes and rivers, winter tundra, ice packs and ice islands, are given. Emergency equipment and search-and-rescue operations are discussed; a good LF/MF radio transmitter and a reel of antenna wire are claimed the most essential emergency equipment; the importance of staying close to the aircraft while waiting for rescue, is emphasized; construction of shelters, protection against insects and animals, and means and procedures of emergency signalling are explained.

53390. MORENUS, RICHARD. DEW line; Distant Early Warning, the miracle of America's first line of defense. New York, Rand McNally, 1957. 184 p. plates.

Describes planning and construction of the 3,000-mile radar chain extending from Pt. Barrow to Baffin Island. Construction was started (1952) along the north Alaskan coast, undertaken by the Bell System as primary contractor and Western Electric as sub-contractor. This part of the chain was completed by 1953; the second phase, across the northern coast of Canada, was started in 1955 by the same company. Preliminary construction equipment and supplies were flown in by military and commercial aircraft. Organization of the airlift, problems of airdrop, freight handling, etc. are discussed. In June/July 1955, two 60-vessel fleets, one out of Norfolk, Va., other from Seattle, carried additional supplies and heavy equipment into the eastern and western Arctic for delivery at radar sites along the Canadian archipelago. The achievements of HMCS *Labrador*, leader of the eastern convoy, are stressed. Personnel, housing at construction sites, local native labor, etc. are discussed. A brief description is given of the floating and airborne radar stations forming the remainder of the 10,000-mile distant early warning chain. Radar screens and observation posts south of the DEW Line are briefly dealt with, and the ability of U.S. and Canadian forces to ward off an attack from the north, is discussed. ***Copy seen:*** DLC.

53396. MOROZOV, A. I. Shchelochnye granity Srednego Ponoîa. (*In:* Akademiîa nauk SSSR. Kol'skiĭ filial. Shchelochnye granity Kol'skogo poluostrova, 1958. p. 66–85, illus., tables, text maps.) Text in Russian. ***Title tr.:*** Alkaline granites in the middle course of the Ponoy River.

Reviews geologic and stratigraphic characteristics of the area (approx. 66°55′–67°15′ N. 37°55′–38°45′ E.) and describes microcline granite, biotite, amphibolic-biotite gneiss and amphibolite, metabasite, gabbro-anorthosite and other rocks in which alkaline granites are injected. Two independent alkaline granite massifs are treated in detail. Appearance and extent of these massifs are described. Variety, fracturing mode and occurrence of alkaline granites in quartz and pegmatite veins are outlined. Features of texture and structure, predominant minerals, and chemical and physical properties are examined and data presented in tables and diagrams. Aspects of genesis are summarized. ***Copy seen:*** DLC.

53397. MOROZOV, A. I., *and* **A. M. SHUKEVICH.** Shchelochnye granity zapadnoĭ chasti Kol'skogo poluostrova. (*In:* Akademiîa nauk SSSR. Kol'skiĭ filial. Shchelochnye granity Kol'skogo poluostrova, 1958. p. 190–96, table.) Text in Russian. ***Title tr.:*** Alkaline granites in the western part of Kola Peninsula.

Alkaline granites have a limited distribution in western Kola and occur in blanket- and cross-veins, 150-200 m. maximum thickness. Three groups are distinguished: granites spatially connected with granulated formation; those extending in the contact zones between granulites and surrounding gneiss and gneissose-granites, and those spaced in the stratum of oligoclase-granites. Each group is briefly characterized; its location and appearance outlined. Subalkaline microcline granites, alkaline granites and alkaline syenites are more precisely treated. Their geologic position, component minerals, color, texture, and other properties are summarized.

Text in Russian. ***Title tr.:*** Production specialization of the collective farms in Yakutia.

Agriculture of Yakut A.S.S.R. is divided into five main classes: stock raising/farming; stock raising/trade; trade/reindeer breeding; reindeer breeding/trade; reindeer breeding for transport/beginnings of farming. Map shows distribution of these classes, also of two related but subsidiary economic activities; dairying/market-gardening, and fishery. The reindeer/trade and the fishery zones extend to the north coast, stock-raising/trade to Nizhne-Kolymsk in northeastern Yakutia. Each class (or zone) is characterized in turn with (percentage) data on workers, stock, finances. The predominant class, prevailing in central Yakutia, is stock-raising/farming, and it is considered in three sections, as: mainly livestock, mainly farming, and mixed. Kolkhozes of this region are indicated on map (p. 13) according to their specialization.

reported in Newfoundland in 1943 (also in Northwest Territories) and now considered a major pest of cruciferous crops. Only one generation was observed; it is unusually free of natural enemies. Satisfactory control was obtained with DDT either as spray or dust. ***Copy seen:*** DA.

53404. MORRIS, ROBERT HAMILTON, 1921– . Reconnaissance study of the Marsh anticline, northern Alaska. Washington, D.C., 1957. 6 p., fold. map. Mimeographed. (U.S. Geological Survey. Reports, open file series, no. 405.) 3 refs.

Preliminary geologic study of a part of Naval Petroleum Reserve No. 4, along lower Marsh Creek (approx. 69°55′ N. 144°55′ W.), field checked in July 1953. Previous work in the area, location, topography and drainage are indicated; followed by discussion of the Tertiary sandstones and shales, and the Quaternary upland gravels and Recent alluvium. Strata are described, presence of fossils is noted. Correlation of the section with the Sagavanirktok formation (Tertiary) further west is suggested. Remarks on the upland gravels (Pleistocene?) lying unconformably on the Tertiary strata, and the Recent alluvial deposits are included, followed by structural comments on the Marsh anticline.

53405. MORRIS, T. R., *and* **S. FOX.** Artificial light and sexual maturity in the fowl. (Nature, *London*, Nov. 29, 1958. v. 182, no. 4648, p. 1522–23, table.) 2 refs.

Account of experiments with chicks hatched on Dec. 4th (latitude 51°27′ N.) part of them given supplementary illumination, the others, serving as controls, remaining under natural conditions. The results of the two illuminated groups show "that sexual maturity is affected by changes in day-length and not by the absolute day-length." ***Copy seen:*** DLC.

53406. MORRIS, T. R., *and* **S. FOX.** Light and sexual maturity in the domestic fowl. (Nature, *London*, May 24, 1958. v. 181, no. 4621, p. 1453, illus., table.) 4 refs.

Account of experiments (initiated in 1954) involving additional, artificial illumination. It is concluded "that the rate at which a pullet approaches sexual maturity is increased by increasing lengths of day and decreased by decreasing lengths of day." The practical aspects of the findings are discussed.

53423. MOTYCHKO, V. F. Olivinity i slŭdity massiva Odikhincha. (Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Informatsionnyĭ bŭlleten', 1958. vyp. 10, p. 25–31, tables.) 2 refs. Text in Russian. ***Title tr.:*** Olivinites and micas of the Odikhincha massif.

Presents mineralogic and petrographic characteristics of olivinites and micas in material collected by the author, 1956–57, from cross-sections of the Kotuy valley in the ultrabasic and alkalic Odikhincha massif. Various forms of olivinite occurrence are reviewed, with olivine as the predominant mineral. Replacement of olivine through contact-metasomatism mainly by magnesium mica-phlogopite and diopsite or nepheline is noted. Chemical and spectral analyses of olivinite and phlogopite are presented. Physical properties of newly formed phlogopite are outlined.

53428. MOWLL, J. U. Prospects for nuclear power in Canadian mineral

industries. (Canadian geographer, 1958. no. 11, p. 34–42, map.) 6 refs.

Considers mining areas, mostly in the North, where nuclear power might be installed, its advantages and disadvantages; also the availability and cost of other energy sources. Areas inaccessible by surface transport and lacking local power sources are likeliest localities; of such is most of the interior of the Canadian Shield, e.g., Coppermine. In areas accessible to bulk shipments of coal or oil but short of hydro power, comparative costs are the determining factor. Mines of the Yukon (e.g. Keno Hill with the highest power costs in Canada), Belcher Islands, and the Ungava Bay region might benefit from nuclear power, but not, e.g. Inuvik, receiving oil from Norman Wells by cheap water transport, nor Pine Point developments with a proposed hydro plant at Fort Smith. Map shows distribution of power costs in mineral industries throughout Canada.

53432. MOZESON, D. L., *and* N. A. UTENKOV. K voprosu ob izuchennosti fiziko-geograficheskikh uslovii Severo-Vostoka SSSR i zadachakh dal'neishikh issledovanii. (Problemy Severa, 1958, vyp. 2, p. 91–115, illus., tables, map.) 99 refs. Text in Russian. ***Title tr.:*** Status of studies of physical geographic conditions of the Northeast of the U.S.S.R. and the tasks of further explorations.

Brief survey of results of recent explorations north of 60° N. between the Lena River and Bering Sea (eastern Yakut A.S.S.R. and Magadan Province). Four geomorphic regions are distinguished in the area: the Yana-Chukotka mountainous region, comprising the Verkhoyansk, Suntar-Khayata, Cherskogo, Dzhugdzhur, Okhota-Kolyma, Omolon-Yablonskiy, Chukotka, Polousnyy and Alazeya Ranges or plateaus and the Chauna and Tauy valleys; the Koryak-Kamchatka mountainous region; the East Siberian plain; the Anadyr'-Penzha depression. For each in turn, the main information on their orography, mineral resources, climate, hydrology, vegetation and fauna is given from published and unpublished reports of the Geologic-Prospecting Administration of Dal'stroi, Main Administration of the Northern Sea Route, and of other scientific and economic organizations. The existence of 953 glaciers and snow-fields with a total area of 600 km.^{2} is known from investigation of the glaciation, chiefly in Suntar-Khayata (208 glaciers),

Cherskogo Range (205) and Koryak Plateau (461). The lowest mean monthly temperatures are observed at Oymyakon (63° N. 142°45′ E.), Verkhoyansk ranging second. The large accumulations of snow cause devastating spring floods but the rivers dry up in summer. There are rich gold deposits in a 1,000 km. zone from the right tributaries of upper Kolyma to the Adycha River (right tributary of the Yana); tin deposits are noted (p. 95). Objectives in further systematic exploration are discussed. ***Copy seen:*** DLC.

53438. MÜNTZING, ARNE. Apomictic and sexual seed formation in *Poa*. (Hereditas, 1933. bd. 17, häfte 2, p. 131–54, 21 illus., 4 tables.) 30 refs.

Contains results of cytogenetic study of *Poa alpina* and *P. pratensis* both derived from Norrbotten province (Luleå and North Bedåkra). Thirteen different chromosome numbers were determined in *P. alpina*, ranging from 22 to 38; eleven of them are aneuploid. In at least three Swedish biotypes, the seed formation is apomictic. The chromosome numbers of eight biotopes of *P. pratensis* have been found, seven have aneuploid numbers, ranging from ±64 to ±85. One biotope has 2n=49 (heptaploid). In at least four biotopes the seed formation is apomictic.

53439. MÜNTZING, ARNE. Cytogenetic studies on hybrids between two *Phleum* species. (Hereditas, 1935. bd. 20, häfte 1–2, p. 103–136, 51 illus., 11 tables.) 18 refs.

Includes chromosome numbers determination of a series of timothy grass (*Phleum*) types. In *P. alpinum*, two biotypes from northern Sweden (Pajala and Pello) were tetraploid (2n=28), a third, from Switzerland, however, proved to be diploid (2n=14). Besides a majority of hexaploid *pratense* and diploid *nodosum*, some individuals were found to have 2n=35 or 36. ***Copy seen:*** DLC.

53440. MÜNTZING, ARNE. The cytological basis of polymorphism in *Poa alpina*. (Hereditas, 1954. bd. 40, häfte 3–4, p. 459–516, 28 illus., 7 tables.) 34 refs.

This grass from northern Sweden (including Lapland and Norrbotten) and Greenland was studied with regard to chromosome number, morphology and degree of constancy caused by apomictic seed formation or vivipary. In the seed-forming types from north Sweden, 18 different chromosome numbers were found, ranging from 32 to 50, the numbers 33 and 38 predominating and a third maximum at 44. The material from Greenland shows similar range of chromosome numbers. The progenies raised were mainly uniform but comprised a low proportion of deviating plants. Enormous morphological diversity is revealed between the various progenies. The material from north Sweden could be divided into 19 morphological groups and a number of specific biotypes. The average degree of apomixis and the average chromosome number in *P. alpina* are lower in Switzerland and Poland than in Scandinavia. New biotypes are not only produced through occasional fertilization but probably also through mutation without change in chromosome numbers.

53441. MÜNTZING, ARNE. Further studies on apomixis and sexuality in *Poa*. (Hereditas, 1940. bd. 26, häfte 1–2, p. 115–90, 33 illus., 13 tables.) 33 refs.

Contains results of cytogenetic studies of *Poa alpina* and *P. pratensis* based partly on material from Korpilombolo and Pajala in northern Sweden and from Tromsø, Norway. Of eight different apomictic strains of *P. alpina*, four were constant in morphology and chromosome number (33, 38, and 35). Meiosis in apomicts was found to be irregular. Selection for high and low chromosome numbers in sexual *P. alpina* was undertaken: it gave some offspring with chromosome numbers ranging from 25 to 64, and a stable but still sexual strain with 22 chromosomes. Another case of secondary balance was met in a sexual polyhaploid of *P. pratensis* having 2n=36. Crosses between a sexual and an apomictic *P. alpina* strain were undertaken; the chromosome numbers of the parent were 24 and 38. In F_1 the chromosome numbers ranged from 25 to 43. The F_1 plants had good fertility and were quite sexual. All F_2 plants tested were found to be sexual.

53446. MULLER, ERNEST HATHAWAY, 1923– , *and* **H. W. COULTER.** Incipient glacier development within Katmai caldera, Alaska. (Journal of glaciology, Mar. 1957. v. 3, no. 21, p. 13–17, 3 illus.) 7 refs.

Results of observations in 1953 at Mt. Katmai (58°16′ N. 154°59′ W.). Ice cliffs produced by beheading of the glaciers in the 1912 eruption have thinned and shrunk away from the rim of the caldera, except in the southwest. There, an ice fall descends part way down the crater wall. Two small glaciers have formed within the caldera on large masses of slumped wall-rock below the north and south rims, approx. 1,525 m. above sea level. Elsewhere crater walls are sheer and permanent snowbanks cannot accumulate. The lake, rising more than five m./yr. deters glacier development in the caldera. ***Copy seen:*** DGS.

53447. MULLER, ERNEST HATHAWAY, 1923– , *and* **H. W. COULTER.** The Knife Creek glaciers of Katmai National Monument, Alaska. (Journal of glaciology, Oct. 1957. v. 3, no. 22, p. 116–22, 3 illus., 2 text maps, table.) 7 refs.

A group of previously unmapped glaciers on the slopes of Trident and Katmai Volcanoes (approx. 58°15′ N. 155° W.) was studied in summer 1953 for information on the abnormal regimen produced by the 1912 eruption of Mt. Katmai in which five sq. mi. of the summit above regional snow line was destroyed, and the beheaded glaciers were buried under pumice and ash. Field data indicate that the terminus of Fourth Glacier has been essentially stationary

since the 1912 eruption. Upper portions have thinned, exposing the rim of the caldera which 40 yrs. ago was partly ringed with fringing ice cliffs. Permafrost has developed to within a few feet of the surface of the pumice mantle. Under prevailing climatic conditions Fourth Glacier may be preserved in its present static condition for an indefinite period.—From authors' abstract.

53448. MULLER, JAN ENGLEBERT, 1917– . Kluane Lake map-area Yukon Territory. 115 G and F E½. Ottawa, Queen's Printer, 1958. 9 p. fold. map in pocket. (Canada. Geological Survey, Paper 58–9.)

Presents preliminary map, scale 1:253,440, and brief account of the area 61°–62° N. 138°–141° W., based on field work of 1950–1953 and 1956–1957. The area is divided into two distinct geological regions by the Shakwak valley: to the northeast, part of the metamorphic and intrusive complex called the Yukon Plateau; to the southwest, a structurally complex assemblage of sedimentary, volcanic, and intrusive rocks that form the St. Elias Mts. Rocks of the Yukon Plateau contain no fossils; cannot be correlated with rocks of the St. Elias Mts.; the latter are from Devonian to Tertiary in age. Extent of glaciation and presence of a layer of white ash and pumice are noted. Main structural feature is the Shakwak lineament, a tectonic hingeline separating the two portions of the area. Gold is recovered; nickel has been mined; coal has been observed. Map shows distribution of geologic features.

The relation between snow crystal types, cloud form, and the temperature and humidity of the snow-generating level is examined on the basis of radiosonde measurements at Sapporo, Japan during the winter of 1955–56. Needle crystals occurred most frequently at a temperature of −8° C. in the generating level, dendrites at −14° to −16° C., plates at −18° to −20° C., columns at −23° to −25° C., and spatial plates at −20° to −24° C. The relative humidity at which the crystals were observed ranged from 81–120%. Dendrites, spatial dendrites, and irregular crystals were mainly produced in convective clouds, while columns, needles and spatial plates formed in stratiform clouds. ***Copy seen:*** DWB.

53459. MURGATROYD, R. J., *and* R. M. GOODY. Sources and sinks of radiative energy from 30 to 90 km.

(Royal Meteorological Society. Quarterly journal, July 1958. v. 84, no. 361, p. 225–34, graphs, tables.) 27 refs.

The absorption of solar radiation and the exchange of long-wave terrestrial radiation are computed for the 30 to 90 km. region for all latitudes, using the climatological mean temperatures given in No. 53460. Over most of the earth's surface, there is a close approach to radiative equilibrium at the levels considered. In the polar regions, however, there is a significant departure from radiative equilibrium with excess heating during the summer and excess cooling during the winter.—From authors' abstract. ***Copy seen:*** DGS.

53460. MURGATROYD, R. J. Winds and temperatures between 20 km. and 100 km., a review. (Royal Meteorological Society. Quarterly journal, Oct. 1957. v. 83, no. 358, p. 417–58, 9 diagrs., 7 tables.) 186 refs.

Outline and synthesis of information published before 1957, as background for measurements of the IGY. Work on temperatures and winds of the troposphere and stratosphere during the past 20 years is traced. Theoretical considerations are treated, particularly temperature distribution and its control by the radiation field. Other physical factors likely to affect the wind field are considered. Experimental methods and available measurements are summarized. Basic theoretical assumptions are stated; measurements from balloons, observations of the drift of smoke from shells and rockets, anomalous sound-propagation phenomena, measurements from high-altitude rockets, from searchlights, from visual, photographic and radio observations of meteors, reports from noctilucent clouds, studies of radio propagation, the airglow and the aurora are reviewed, and summarized in diagrams. Temperature and zonal wind observations are combined, compared with calculated results, and the combination is used to suggest a standard atmosphere whose temperature, zonal wind, and pressure characteristics are illustrated in tables and diagrams. Measurements shown are extended (where possible) into arctic and subarctic areas, in some cases to the North Pole.

Murmansk Province, founded on May 28, 1938 to comprise Kola Peninsula and some territory south and west of Kandalakshskaya Bay, 114,800 km.^{2} in area, is divided into eight districts with 474,000 population at the beginning of 1956 (168,000 in the city of Murmansk). Data on its economic development and conditions to 1956 are presented in sections: general information; industry; agriculture; capital construction; municipal economy; transportation and communication; workers, numbers, their training; commerce and public road service; education, science and art (kul'tura); health service. Industrial production, increased 199-fold from 1913 to 1956 (p. 21), is outlined in detail for fisheries, timber, electric power and light industry, but mostly omitted for the mining, chemical and metallurgical industries. Data of collective and state farms are given and causes of their decline in number are explained (p. 34); land under cultivation increased from 3,600 hectares in 1940 to 6,015 in 1956; reindeer herds, over 70 thousand in 1940, decreased to 53 thousand in 1950, and recovered to over 69 thousand by 1956; data on distribution of land, livestock and reindeer between state, collective and subsidiary farms and individual owners are given, p. 35–38. Schools increased from 47 in 1927/28 to 294 in 1956/57, but scientific institutions decreased from 15 in 1940 to 10 in 1956.

The decidedly continental climate (winter temperature down to −68.7° C. and up to 38° in summer, 190–220 mm. annual precipitation and dry summers, poor soils over permafrost throughout all Yakutia) prescribes special methods in agriculture. Problems of crop rotation, soil cultivation, manuring, fertilizing and vegetable growing are briefly discussed. The advance of agriculture is handicapped by cultivation of small scattered parcels of land; their consolidation into 20–25 hectare lots, leaving 50–200 m. strips for protective forest shelter-belts, is advocated. ***Copy seen:*** DLC.

53483. NAÏDIN, D. P. Voprosy opredeleniîa klimaticheskikh usloviĭ proshlykh geologicheskikh periodov metodom izotopnoĭ paleotermometrii. (Sovetskaîa geologiîa, July 1958. god 1, no. 7, p. 15–34, tables, diagrs.) 29 refs. Text in Russian. Summary in English. ***Title tr.:*** Problems of determination of climatic conditions in the past geologic periods by means of the isotopic paleothermometric method.

Reports the results of American and Russian investigations in determination of sea temperatures in the past geological periods by stating the isotopic composition of oxygen in the calcite of fossil organisms. The method of isotopic paleothermometry is based on evenly balanced distribution of heavy isotopes of oxygen between the oxygen of water and calcite precipitated from it. The accomplishments with this method in solution of geologic problems are summarized, and its possibilities indicated for problems also of paleobiology, lithology, stratigraphy and permafrost. Noted among others is its use on saline and fresh-water samples from Greenland, silicate rocks from Greenland and Labrador, and belemnite fossils from the Siberian platform. Further tasks are mentioned. American literature (C. Emiliani, S. Epstein, W. W. Rubey, H. C. Urey) is extensively cited.

Deals (p. 441–46) with the ice-strengthened *Erebus* and *Terror* used for arctic and antarctic voyages 1836–1848 and lost on the last Franklin Expedition; the *Hecla* and *Griper* used by Parry in 1819–20 and on three later voyages; also mentions (no descriptions) the *Enterprise*,

Investigator, *Resolute*, *Assistance* and *Fox* participating in the Franklin Search. Nordenskiöld's *Vega* which completed the Northeast Passage in 1878–1879, Nansen's *Fram* launched in 1892, and Amundsen's *Gjöa*, first to complete the Northwest Passage, 1903–1906, are noted, also the R.C.M.P. *St. Roch* which completed the Passage in both directions 1940–1942, 1944. ***Copy seen:*** DLC.

53487. NAMIAS, JEROME, 1910– , *and others.* Application of numerical methods to extended forecasting practices in the U.S. Weather Bureau. (*In:* Monthly weather review, Dec. 1958. v. 86, no. 12, p. 467–76, 7 text maps, 4 diagrs., table.) 9 refs. *Other authors:* C. R. Dunn, A. F. Krueger, *and* B. M. Lewis.

Contains substance of paper presented before the Scandinavian-American Meteorological Meeting in Bergen, June, 1958. Three new procedures for applying numerical methods to 2–7 day forecasting are described: trend, summation, and basic current methods. These are used to compute a prognostic 500 mb. mean contour pattern; north polar charts compare predicted and observed pressure at 500 mb. and at sea level. Possible use of these procedures for extended temperature and precipitation forecasts is considered. ***Copy seen:*** DWB.

53488. NAMIAS, JEROME, 1910– . Characteristics of the general circulation over the Northern Hemisphere during the abnormal winter 1946–47. (U.S. Weather Bureau. Monthly weather review, Aug. 1947. v. 75, no. 8, p. 145–52, 6 text maps, 5 diagrs.) 4 refs.

Describes circulation and associated weather anomalies, based on study of monthly mean charts of pressure and departure from normal for the period Dec.-Mar. Unusual pressure distribution both at sea level and aloft, was characteristic of several arctic areas. Reasons for the abnormal circulation and its persistence are discussed and illustrated by pressure and wind speed profiles, and examples of anomalies. ***Copy seen:*** DWB.

53489. NAMIAS, JEROME, 1910– . The general circulation of the lower troposphere over arctic regions and its relation to the circulation elsewhere. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 1, *pub.* 1958. p. 45–61, maps, graphs.) 20 refs.

Mean height charts for sea level and 700 mb. surfaces for the area north of 40° N. are presented for January, April, July, and November of the eight-year period 1948–1955. The resulting values are discussed and compared with earlier estimates. While there are significant differences, large-scale aspects of the circulation have not altered during this century. The major differences shown by these as compared with earlier charts appear to be: an increase of a few mb. in sea-level and mid-tropospheric pressures in Jan. April and Nov. over the Davis Strait - Baffinland - Greenland area; a decrease in the sea-level and upper-level pressures of 1–4 mb. in the center of the Arctic Basin for each of the four months; and a greater tendency during the non-summer months for the Aleutian Low to be split into two cells with the corresponding emergence of an additional trough in the planetary circulation.

53490. NAMIAS, JEROME, 1910– . Synoptic and climatological problems associated with the general circulation of the Arctic. (American Geophysical Union. Transactions, Feb. 1958. v. 39, no. 1, p. 40–51, text maps, diagrs.) 21 refs. Paper presented at the International Union of Geodesy and Geophysics, Association of Meteorology, Eleventh General Assembly, Toronto, Sept. 3–14, 1957.

Notes increased accumulation and improved analysis of data over ten years, making possible a better picture of normal characteristics of the general circulation over arctic regions. Maps showing approximate long term normals for Jan., April, July, and Oct. are presented; interrelation of prevailing circulations with the nature of the underlying surface, with the season, and with the type of synoptic development is noted. Large climatic fluctuations are described and illustrated. Day-to-day variations over the Arctic and the associated prediction problems seem similar to those of temperate regions and are amenable to present numerical methods. Longer period fluctuations present a more difficult problem.—From author's abstract.

53501. NATIONAL RESEARCH COUNCIL OF CANADA. ASSOCIATE COMMITTEE ON SOIL AND SNOW MECHANICS. Permafrost, a digest of current information. Ottawa, Aug. 1957. 48, 3 p. text map, diagrs., typescript. (*Its:* Technical memorandum, no. 49.) 12 refs. Prepared by Directorate of Engineer Development, Army Headquarters, Ottawa, 1949, revised.

Describes characteristics and destructive action of permafrost; discusses engineering problems, factors affecting foundations, roads, bridges, airports and runways, dam and reservoir construction, under permafrost conditions. About half of Canada's area is underlain by permafrost. Its recognition on a prospective construction site is prerequisite to construction practice and methods. Vegetation, topography and geology are considered as indicators of permafrost, and field identification tests are suggested. Choice of a site depends on identification of the soil type (chiefly), water content, and depth of the active layer. Structures resting on clean gravel or sandy strata are not damaged by settling or heaving action; but alternate layers of sand and silt, or a thick stratum of silt create foundation problems. Types (12) of locations for investigation for road construction are listed. In bridge and other large foundations, construction must be based on unit bearing power and figures applicable to the active layer in a thawed condition. Airport site selection involves the same primary considerations, but more difficult problems and greater emphasis on requirements of surface drainage, sub-drainage, and sub-soils, where the strip is to be in all-year use. Location on high ground is also recommended. Water stored in a reservoir will thaw the underlying and adjacent ground; this lowering of the permafrost table may impair the stability of a dam or reservoir. A glossary of 18 terms commonly used, is appended; numerous diagrams illustrate effects of permafrost and solutions to problems. ***Copy seen:*** DWB.

53502. NATIONAL RESEARCH COUNCIL OF CANADA. ASSOCIATE COMMITTEE ON SOIL AND SNOW MECHANICS. Proceedings of the third muskeg research conference, February 20 and 21, 1957. Ottawa, July 1957. 65, 3 p., text map., diagrs. (*Its:* Technical memorandum, no. 47.) refs.

The conference, held at Vancouver, B.C., consisted of a symposium on problems of access over organic terrain. Progress reports from several muskeg research centers, and eight papers were presented and discussed. Five of the papers dealt with arctic Canada or arctic conditions, viz.:

Thomson, J. G. Winter roads over muskeg (p. 18–27). A discussion of economic aspects, engineering problems, and methods of road preparation and construction, citing experience with roads built in connection with the Quebec, North Shore and Labrador Railway, and others for the pulp and paper industry in northern Ontario.

Nowlan, B. C. Route establishment over muskeg in winter (p. 28–32). Extracts from a diary of an operation delivering materials from railhead 400 miles to a site on the south shore of Hudson Bay.

Thomson, S. Some aspects of muskeg as it affects the Northwest Highway System (p. 42–49). Considers new construction over organic terrain, maintenance of roads through muskeg country, the effect of muskegs on costs.

Hemstock, R. A. Access over muskeg (p. 50–54). Reviews progress toward quick and cheap access required for geophysical prospecting; test vehicles, etc.

Radforth, N. W. Problems of access as pertaining to off-the-road vehicles (p. 55–61). Analysis of organic terrain, and discussion of importance of terrain in designating a type vehicle for off-road movement. ***Copy seen:*** DGS.

53503. NATIONAL RESEARCH COUNCIL OF CANADA. DIVISION OF BUILDING RESEARCH. List of publications. Ottawa, Mar. 1958. 24 p.

Lists, with price, over 300 publications, including bibliographies and translations related to building research work; approx. 25% of the papers pertain to low temperature construction, permafrost investigations, soil studies in northern Canada, etc. Author and subject indexes are added. ***Copy seen:*** DLC.

53521. NEBIKER, WALTER A., *and* **S. ORVIG.** Evaporation and transpiration from an open lichen woodland surface. (*In:* International Union of Geodesy and Geophysics. Association of Scientific Hydrology. Report 1957. v. 3 *pub.* 1958, p. 379–84, text map, table.) 11 refs.

Report on measurements of evapotranspiration and evaporation, made at the McGill Sub-Arctic Research Station, Knob Lake, Que., July 1–Aug. 31, 1956; as first part of a study of moisture conditions related to an aerial photographic investigation of surface characteristics of Labrador-Ungava, begun in 1948. A battery of evapotranspirometer tanks and two black Bellani plate atmometers, the latter for measurement of latent evaporation, were installed at Knob Lake. Evapotranspiration takes place at this site only from June to September, because of low temperatures; some evaporation occurs from the snow in winter. With a lichen cover, on a burned-over area, the evapotranspiration was only one-third the theoretically estimated amount; the difference attributed to the lichen cover, rather than climatic conditions.

Copy seen: DGS.

53522. NEBIKER, WALTER A. Evapotranspiration studies at Knob Lake, June–September 1956. Montreal, Aug. 15, 1957. 86 p. illus., 2 text maps, diagrs., tables (McGill University. McGill Sub-Arctic Research Laboratory. McGill sub-arctic research papers no. 3. Also: McGill University. Arctic Meteorology Research Group, Publication in meterorology, no. 11.) 27 refs.

Part of a program of research into the radiative and moisture characteristics of different natural surface cover types in the Canadian sub-Arctic. This report defines terms used; describes instruments, site, installation and sources of climatological data; gives a general description of the site (approx. 54°45′ N. 67°00′ W.), surface cover and climate; compares computed with measured evapotranspiration and gives determination of latent evaporation. Distribution of daily evapotranspiration readings and relation of daily readings of latent evaporation to

measured potential evapotranspiration are discussed. Results of climatic parameters are summarized. Author concludes that the use of evapotranspirometers provides a more reliable, "true" index of the climate. Evaporation/transpiration totals for the period July 1–Sept. 5, 1956 indicate that the computed potential evapotranspiration (PE) is 3.4 times, and latent evaporation (LE) 2.5 times as great, as measured PE, partly because of cloudiness, precipitation, and general high albedo. ***Copy seen:*** DN–HO.

53527. NEHER, HENRY VICTOR, 1904– . Cosmic rays near the North Geomagnetic Pole in the summers of 1955 and 1956. (Physical review, July 15, 1957. v. 107, no. 2, p. 588–92, illus.) 10 refs.

Experiments in continuation of those reported in No. 41556, and No. 53528 are described. The cosmic rays as measured in balloon flights at Thule, Greenland were found little changed in 1955 from 1954 (when a solar minimum existed), but they had decreased markedly from 1955 to 1956, becoming even less in 1956 at middle altitudes than in 1937 (cf. No. 2891) when the sun was at a peak of activity. The ionization-depth curve did not, however, pass through a maximum in 1956 as it did in 1937. The shape of the curves in 1956 was similar to those of 1951 when the low-energy radiation was missing and when a "knee" was present in the latitude curve at high latitudes. The average intensity of cosmic rays since 1954 was found to be decreasing with time as the sun approaches its maximum activity.
Copy seen: DLC.

53528. NEHER, HENRY VICTOR, 1904– . Low-energy primary cosmic-ray particles in 1954. (Physical review, July 1, 1956. v. 103, no. 1, p. 228–36, tables, graphs.) 15 refs.

Presents results of balloon flights carried out at Bismarck, N. Dakota, and by a shipborne expedition from Boston via Thule (on the *Atka*) to latitude 83° N. (*Eastwind*). A considerable increase in cosmic-ray intensity, compared with observations in 1951, was recorded. Using the increased areas under the ionization depth curves, combined with geomagnetic calculations, the number of primary particles coming in near the poles is estimated at 0.10 cm.$^{-2}$ sec.$^{-1}$ sterad^{-1} for 1937 (solar maximum), 0.14 for 1951, and 0.24 for 1954 (solar minimum). The fluctuations in 1954 were also small compared with those measured in 1937, 1938, and 1951. The results are found to be in accordance with For-

bush's theory, that there is an inverse relationship between solar activity and cosmic-ray intensity. ***Copy seen:*** DLC.

53529. NEĬSHTADT, MARK IL'ICH, 1903– . Goloťsen na territorii SSSR. (Akademiîa nauk SSSR. Komissiîa po izucheniû chetvertichnogo perioda. Trudy, 1957. t. 13, p. 111–17, table.) Text in Russian. ***Title tr.:*** The Holocene in the territory of the U.S.S.R.

General outline of autochthonous and allochthonous Holocene deposits in the U.S.S.R.: types of deposits, their lower boundary, stratigraphic division, regional features and distribution, paleogeographic zones, climatic conditions, and research methods and tasks. Spore and pollen analyses are emphasized. Attention is given to the emerged coastal areas of the Sea of Okhotsk, Barents, Kara and other seas, where peat turf of different ages has been found on the benches. Importance of Holocene study is stressed. ***Copy seen:*** DLC.

Vegetation of the Thule Peninsula (approx. 76°30′ N. 68°30′ W.) northwest Greenland was sampled along a 16-mile transect between Thule Air Base and Camp Tuto, June 1957. The general vegetation is small and sparse. Grasses

and sedges, found in marshy areas, are the largest plants; most plants are less than five inches high. Typical habitats are illus., stone polygon vegetation diagrammed, and species (14) collected described. The vegetation may be used in emergency for fuel, food, and insulation by individuals or small groups; it is of no value for providing cover or concealment.—From Author's abstract.

Discusses effects of cement type, and heating, mixing, and pouring procedures on the concrete properties. The setting period should be made short by using fresh cement and low water: cement ratio, and by keeping the setting temperature high. Heat generation during setting increases with increasing cement content (max. 400 kg./m^3); the same effect is obtained by using a faster working type of cement. Choice of portland, rapid, or superrapid cement depends otherwise on type and size of construction.

Text in Russian. ***Title tr.:*** Change in the active surface of soils by positive and negative temperatures.

Presents results of experiments made at the Institute of Permafrostology with absorption of $C_{16}H_{18}N_3$ SCl in clayey soil samples, saturated with various cations. Maximum absorption by negative temperatures (−2° C.) was obtained when using a 50% water-alcohol solution. By coagulation the effect of the H-ion was approx. 100 times stronger than that of the Na-ion; the presence of OH-ions in the solution completely neutralized the coagulation effect of the Na-ion. A formula for the fluctuation of the active surface is derived from the experimental data.

Description of conditions in Java monkeys made hypothermic to between 4° and 9° C. with cardiac standstill intervening at 11°–14° C. and lasting from 42 minutes to over two hours. All monkeys survived, and five out of six lived for many months, with their behavior, intelligence, habits and neurological aspects, normal. ***Copy seen:*** DNLM.

NICHOLLS, DORIS, *see* Rossiter, R. J., *and* D. Nicholls. Phosphorus metabolism . . . adrenal . . . cold environment. *1957.* No. 54412.

53559. NICHOLS, BENJAMIN. Drift motions of auroral ionization. (Journal of atmospheric and terrestrial physics, 1957. v. 11, p. 292–93, diagr.) 3 refs. Reprinted as Alaska. University, Geophysical Institute, Contributions, Series A, no. 38.

Measurements of the frequency spectra of VHF echoes from auroral ionization made in Jan.–Mar. 1957, show that the general pattern of the electron drift was horizontally east or west at speeds of 0.5 to 3.0 km./sec. in the region 400 to 900 km. geomagnetically north of College, Alaska. Continuous wave transmitters at 106.0 and 41.15 mc/s were located 40 km. east of College; similar receiving systems were located at College. The frequency spectrum on each channel, in the absence of auroral or airplane echoes, consisted of a single line, whose width was determined by a spectrum analyser. Radar echoes from auroral ionization are frequently spread in range by more than 100 km. Radar results, as well as the measured drift velocities and the suggested electron density, are consistent with magnetic observations.

53560. NICHOLS, R. W. The hardness of some carbon and low-alloy steels at low temperatures. (Iron and Steel Institute. Journal, Apr. 1956. v. 182, pt. 4, p. 348–54, 3 tables, 4 figs.) 9 refs.

Diamond pyramid and ball-hardness tests were made on small rectangular

samples of eight steels at temperatures of +18°, −70°, and −196° C. The hardness was found to increase with decreasing temperature, the percentage rate of increase being in general less than that of the 0.01% proof stress. The U.T.S./Vickers-hardness ratios were found to be almost the same at −70° as at +18° C. The effects of temperature on hardness and tensile properties and on stress/strain curves are interpreted over the entire temperature range.

53561. NICHOLS, R. W. The mechanical properties of carbon steel wire at low temperatures. (Iron and Steel Institute. Journal, Apr. 1956. v. 182, pt. 4, p. 337–47, 5 illus., 3 graphs, 4 tables.) 15 refs.

Tensile, impact, fatigue, and reverse bend tests were made on 0.044 in. diam. wire at temperatures of 20°, −30°, and −60° C. The wires were prepared from steels of approx. 0.5% and 0.75% C and were tested in the conditions of as-drawn, annealed, and electro-galvanized. Test results are tabulated and graphed. In the tensile test, the proof stress and U.T.S., values for all test samples increased with decreasing temperature while the ductility slightly decreased. No marked embrittlement was noted in the temperature range tested. Fatigue endurance limits and endurance ratios for the as-drawn wires were found to increase with temperature decrease while endurance limits of annealed wires appeared relatively unaffected by temperature. In high-strain reverse bend tests, the electro-galvanized wire was superior to the as-drawn wire at room temperature but showed a greater deterioration at −60° C.

Describes the Greenland Trading Company's old store and the new one, opened in 1955, at Upernavik, West Greenland; also the changes in buying and selling methods during the author's three years (1952–55) in charge. The first self-service store in Greenland was opened at Sukkertoppen in 1957 and the experiment was successful. ***Copy seen:*** DLC.

53575. NIELSEN, HENNING. Manitoba pushes ahead on new major nickel source. (Mining engineering, Dec. 1957. v. 9, no. 12, p. 1321–23, illus. map).

Brief account of progress of International Nickel Co. of Canada's program to develop a new mining region near Mystery Lake-Moak Lake (approx. 55° 55′ N. 97°35′ W.), expected to become second only to the Sudbury workings in production. Two mines, the Thompson, and the Moak Lake, are to be opened; production is planned to be 75 million lb./year. A 30-mile rail spur has been built between the new town of Thompson and Sipiwesk on the Hudson Bay line. Little copper has been found, but nickel content of the ore is expected to compare favorably with that from Sudbury. With total production by INCo planned at 385 million lbs. of refined nickel by 1961, new civilian markets are needed. ***Copy seen:*** DGS.

53576. NIELSEN, J. Laks fra Norge i grønlandske elve. (Atuagagdliutit: Grønlandsposten, Aug. 1, 1957. Ukiut 97-iat, nr. 16, p. 10–13, illus.) Text in Danish. ***Title tr.:*** Salmon from Norway in Greenland rivers.

From Kapisigdlitelven (the only spawning stream in Greenland) salmon spawn were moved to another river in the Godthåb Fjord in summer 1956 by Grønlands fiskeriundersøgelser (Greenland Fishery Investigations); and in the autumn the fish were in good condition. Eggs were moved from a hatchery at Hammerfest, north Norway, to a river near Godthåb: 6,000 in 1956 and 25,000, 1957. Over 95% of the first batch hatched. The transport and methods used in these experiments are described. ***Copy seen:*** DLC.

Summary of lecture to the Danish Concrete Association and Construction Engineer Groups. Methods used for building foundations in permafrost areas are described. At station Nord (approx. 81°36′ N. 16°41′ W.) on the north coast, a temporary shed was built of oil barrels welded together for walls and frame, and covered with a tarpaulin. Due to a lack of suitable aggregates in Greenland, more cement than usual is added to the concrete mix. Air injection is also used, and both methods have provided satisfactory results. ***Copy seen:*** DLC.

53578. NIELSEN, LAWRENCE ERNIE, 1917– . Climbs in the central Chugach Mountains, Alaska. (Appalachia, Dec. 1957. v. 31, no. 4, p. 491–97, 2 photos, text map.) Ref.

Account, by leader, of a five-man party's expedition in June–July 1957. Most of the high peaks around the head of Columbia Glacier (61°05′ N. 147°05′ W.) were climbed for the first time. Names and altitudes given to several peaks, routes followed are shown on map. Events of climbing are described. Brief account also pub. in American alpine journal, 1958, v. 11, no. 1, issue 32, p. 92–93. ***Copy seen:*** DGS.

53579. NIELSEN, LAWRENCE ERNIE, 1917– . Crevasse patterns in glaciers. (American alpine journal, 1958. v. 11, no. 1, issue 32, p. 44–51, plate, 2 diagrs.) 3 refs.

Discussion of theoretical basis for formation and spacing of crevasses; ten possible idealized combinations of stresses and the resulting crevasse patterns are diagrammed and described. The significance of spacing of crevasses, depending upon thickness, breaking strength and density of the ice and the acceleration of gravity, is illustrated and discussed. Reasons (five) why active glaciers are more crevassed than stagnant glaciers are given. Like pitch and many plastics, ice is ductile to slowly applied force, but brittle to rapid; thus crevasses form usually where the gradient increases rapidly. ***Copy seen:*** DGS.

53580. NIELSEN, LAWRENCE ERNIE, 1917– . Preliminary study on the regimen and movement of the Taku Glacier, Alaska. (Geological Society of America. Bulletin, Feb. 1957. v. 68, no. 2, p. 171–80, text map, 5 diagrs., 7 tables.) 11 refs.

Applies the mathematical theory of equilibrium glaciers (No. 41612) to data obtained on Taku 1948–1955, during the Juneau Ice Field Research Project. Measurements of net accumulation and distribution of snow at the end of the 1953 ablation season show its quantity to be primarily a function of the elevation above the firn line. Ablation of bare ice below the firn line was determined; about 40 feet of ice melts each year in the Taku terminal area. Detailed studies of movement were made on three transverse profiles where the ice thickness had been measured by seismic methods. Volumes of ice passing through these profiles were calculated from three types of measurements: flow, ablation, and accumulation. The Taku Glacier may be in approximate equilibrium in the terminal region, but much more snow is accumulating in the upper regions than is melting below the firn line.—From author's abstract.

53610. NIKONOV, MIKHAIL NIKOLAEVICH, *and others.* Agrokhimicheskaia kharakteristika torfov v sviazi s ikh ispol'zovaniem v sel'skom khoziaĭstve. (*In:* R.S.F.S.R. Glavnoe upravlenie torfianogo fonda. Sbornik stateĭ . . . 1956, p. 101–132, diagrs., tables.) 62 refs. Text in Russian. *Other authors:* A. A. Grebenshchikova, TS. I. Minkina, G. V. Golgofskaia, and I. S. Boiarkina. ***Title tr.:*** Agrochemical characteristics of peats in connection with their utilization in agriculture.

Rational large-scale use of peat and its composts as fertilizers is described in detail and illustrated by graphs; 18 types of peat are examined for characteristics affecting vegetational properties. Effects of pure ventilated peat and its composts with manure, phosphoric and lime ingredients are analyzed. Agrochemical indexes of peat (life-stimulating effects on vegetation) are discussed: its improvement of physical and chemical properties of soils includes increase of humus substances essential to vegetation and microorganisms. The agrochemical characteristics are evaluated on the basis of the following coordinated data: botanic composition, degree of decomposition, ash content, acidity (pH = 2.8–7.5) content of: nitrogen (0.8–3.8%), calcium (5%), phosphorus (8%), iron (3.0%), sulphur (0.5–10%), mobile aluminum. Positive and negative effects of these components, (particularly of acidity and mobile aluminum and their neutralization) are discussed with reference to specific conditions.

Following a morphological and taxonomic outline of these bristleworms and notes on anatomy and physiology, 23 species are described, five of them new. Four or five species are arctic, but none of them new. Morphology, anatomy, habitat, distribution, etc. are noted.

Copy seen: DLC.

53615. NILSSON, GUNNAR. Zur Flechtenflora von Ångermanland. (Arkiv för botanik, 1932. bd. 24, no. 3, p. 1–122.) Text in German. ***Title tr.:*** A contribution to the lichen flora of Ångermanland.

Contains a brief survey of the lichen flora of this province in northeast Sweden, and of investigations prior to the author's trip in 1930. The botanical aspects are treated and an annotated list of species given with distributional data, notes on habitat, and descriptions of a few new species. ***Copy seen:*** DA.

53616. NILSSON, SVEN. On some Swedish freshwater Hyphomycetes; preliminary notes. (Svensk botanisk tidskrift, July 2, 1958. bd. 52, häfte 2, p. 291–318, 14 illus.) 42 refs.

Twenty-one species of these aquatic fungi are described; among them *Tetracladium marchalianum* from Torneträsk and *Alatospora acuminata,* Laksjön, Abisko. ***Copy seen:*** DA.

53617. NILSSON, TORE. Better, bigger dams; the Swedish contribution. (Engineering news-record, Sept. 11, 1958. v. 161, no. 11, p. 60–66, illus., diagrs., map.)

Reviews construction methods and designs of major Swedish hydro-power dams, five of them in the far North: Suorva, Porjus, Harsprånget, Ligga, and Messaure. Earthfill and rockfill dams are favored; a thin core of concrete or wood provides safeguard during the stabilization period. A wet-fill method, involving compaction of the moraine at a water content near the liquid limit of the material, is widely used. Most constructions call for specially designed log flumes to conduct floating timber past the dams. Advanced construction methods have reduced costs by 50% over the last ten years. Dam construction involves abandonment of salmon fishery in rivers, and its increase in the sea.

Describes 2,150 t. dw. cargo vessel recently delivered to the J. Lauritzen Co., Copenhagen, by Aalborg Vaerft A/S. It is strengthened for navigation in ice, has diesel engines of 2,020 i. hp., and makes 12.5 knots. Provision is made for 12 passengers, or 36 with 1,950 t. dw. cargo. ***Copy seen:*** DLC.

53622. NORD-NORGES NAERINGSLIV, produksjon og handel; utgaven 1954–55. Oslo, Halvorsen & Larsen, 1954. 447 p. illus., maps, diagrs., tables. Text in Norwegian. ***Title tr.:*** North Norway's industries, production and trade; 1954–55 edition.

Trade directory and survey, first of a planned series of such publications on Norway's three northernmost counties: Nordland, Troms, and Finnmark; prepared in cooperation with the "Utbyggingsfondet for Nord-Norge" (the Development Fund for North Norway). Basic information is provided in some 25 short articles by public officials on most phases of economic activity in the area: fishery, agriculture, forestry and the wood industry, mining, the dairy, construction, chemical, textile, food, iron and metal, etc. industries, tourism, trade, etc., together with description of communications, electric power, water supplies, mineral resources, etc. Activities of the Development Fund are outlined, also educational facilities provided by trade schools in North- and South Norway. Advertisements of the informative type accompany these articles with data on the companies' origin and development, assets, range of products, etc. A comprehensive directory of public offices and officials with addresses, telephone, is appended (p. 367–97), also an index to the companies represented by advertisements (p. 399–418), and a products index (p. 421–43).

53623. NORD- OG SØR-NORSK NAERINGSLIV; fiskeindustri, fiskerier, produkjon og handel: II. utgaven, 1955–56. Oslo, Halvorsen & Larsen, 1956? 352 p. illus., maps, diagrs., tables. Text in Norwegian and English. ***Title tr.:*** North and South Norwegian industries; fish processing industry, fisheries, production and commerce. 2nd edition 1955–56.

Second of a series of informative publications on Norwegian industries, this volume surveys in some 25 articles (several in English as well as Norwegian) by public officials, most phases of the country's fisheries industry. Legal matters, organization, equipment and methods, research, sales organization and export, processing plants, future expansion requirements in the North, etc., are dealt with, also salmon fishery in the North, sealing, and whaling. Scandinavian and international conferences on fishing and whaling are reviewed. Production statistics are included, also a directory of processing plants, and an index to products not represented in the first edition; as in the latter (*supra*), advertisements are of the informative type. ***Copy seen:*** DI.

53624. NORDENSKIÖLD, HEDDA. Cyto-taxonomical studies in the genus *Luzula,* I; somatic chromosomes and chromosome numbers. (Hereditas, June 1951. bd. 37, häfte 3, p. 325–55, 6 illus., 5 tables.) 31 refs.

Contains results of cytological investigation of 36 species of *Luzula,* at least seven native to northern Scandinavia, Alaska and northern Canada. About one-third of investigated species have 12 chromosomes of equal size in the nucleus. Three different kinds of chromosomal deviation from the standard pattern have been traced: an ordinary type of polyploidy (tetraploids, hexaploids or octoploids); a special type of polyploidy in

which the chromosome size regularly decreases when the number of chromosomes increases; chromosome races of certain species with a particular type of aneuploidy, which has been interpreted as a half completed endonuclear polyploidy. The endonuclear polyploidy or its related type of aneuploidy is found in all three subgenera of *Luzula*. As a plausible explanation of these chromosomal deviations a regularly acting fragmentation seems to be the most likely. ***Copy seen:*** DLC.

53625. NORDENSKIÖLD, HEDDA. Cyto-taxonomical studies in the genus *Luzula*, II; hybridization experiments in the compestris-*multiflora* complex. (Hereditas, 1956. bd. 42, häfte 1–2, p. 7–73, 9 illus., 19 tables.) 13 refs.

Contains cytological data on species of the complex, including *L. groenlandica* and some of its hybrids occurring in northern Canada, referred to different levels of polyploidy, from the diploid to the octoploid level (table 2). The true diploids have 2n=12. The taxonomical units of the diploid level are all easily hybridized (tables 3–8) and the fertility of the first and second generations is fairly good (tables 18–19). All the taxonomic units of the tetraploid level cross easily. Hybridization between species belonging to different levels of polyploidy is possible only between the tetraploid and hexaploid or between the hexaploid and the octoploid level (table 15). Hybridization between the endonuclear polyploids is possible when they belong to the same level of polyploidy. It has been found that the species belonging to the diploid level are more easily crossed and the hybrids more fertile than is the case with the hybrids between the tetraploid units. The polyploids of the complex seem to be more variable than the diploids. From the data obtained, an attempt has been made to formulate a probable path of evolution of taxonomical units of the complex investigated. ***Copy seen:*** DLC.

53626. NORDENSKIÖLD, HEDDA. Hybridization experiments in the genus *Luzula*, III; the subgenus *Pterodes*. (Botaniska notiser, 1957. v. 110, no. 1, p. 1–16, 2 illus., 4 tables.) 9 refs.

Seven species of the subgenus *Pterodes*, including *L. rufescens* from northeastern Asia and Alaska, were studied and hybrids were obtained in all possible cross combinations. The F_1 hybrids are usually almost or completely sterile except the one between *L. forsteri* and *L. luzulina*. The hybrids between *L. johnstonii* and the European species have a relatively high fertility. Europe seems to be the center of the species of *Pterodes*. ***Copy seen:*** DLC.

53627. NORDERHUS, H. Skogbruket i Nord-Norge; statens skoger. (Skogbrukeren, Apr. 15, 1954. årg. 29, nr. 8, p. 113–16, illus.) Text in Norwegian. ***Title tr.:*** Forestry in North Norway; national forests.

Survey of the three northern provinces, Nordland, Troms and Finnmark, with emphasis on national forests. Nordland south of Saltfjellet and the Arctic Circle belongs botanically to Nord-Trøndelag and the coniferous forests consist of spruce. North of the Arctic Circle, Norway has 170,000 hectares (ca. 425,000 acres) in pine. In Nordland and Troms, natural regeneration follows upon thinning out old trees. Because of the climatic conditions and northern location, pine does not grow well in Finnmark, and natural regeneration is poor; it is used locally, chiefly for building material. Northern Norway has half of the hardwood of the entire country, chiefly birch. Since World War II forest cultivation has been strengthened by better care of existing forests and by planting of conifers in earlier hardwood areas. ***Copy seen:*** DA.

53628. NORDERHUS, H. Skogstuer i Aust-Finnmark og Lyngen. (Skogbrukeren, Mar. 15, 1954. årg. 29, nr. 6, p. 85–86.) Text in Norwegian. ***Title tr.:*** Forest huts in East Finnmark and Lyngen.

The forest inspector for North Norway shows, in response to criticism, that the huts in East Finnmark (sparsely populated, with temperature to −40° C.) are satisfactory; in Lyngen (69°36′ N. 20°10′ E.), a well-populated area where forestry workers live at home, two huts were built to accommodate overnight travelers. ***Copy seen:*** DA.

Describes limited experiments with paraffin wax scale models of icebreakers of 2,220 and 4,350 t. displacement, equipped with two aft and one fore, and two aft and two fore propellers. The variously pitched propellers are described and illustrated; tests were made in open water only, no attempt was made to create turbulence or ice conditions. Data on friction, propeller and propulsion efficiency, effective and shaft power, etc., are tabulated and graphed; wake fractions and thrust deduction factors are calculated. ***Copy seen:*** DLC.

53633. NORDSTRÖM, L. Frörfrågan i Norrlands höjdlägen. (Skogen, *Stockholm,* Oct. 15, 1952. årg. 39, nr. 10*, p. 108.) Text in Swedish. ***Title tr.:*** The question of seed in high altitude areas in Norrland. Summary of lecture given at the Swedish Forestry College.

Shortage of seed due to frequent inability to ripen, and the poor viability of seedlings during the first period of growth in this area are explained. Warmth, moisture and light are required for seed growth. Author's experiments with illumination of seed prior to sowing to improve viability are outlined and the effects of light on seed are described in detail. ***Copy seen:*** DA.

53634. NORÉN, S. M. The nominal cleavage strength of steel and its importance for welded structures. (Shipbuilder and marine engine builder, Apr. 1957. v. 64, no. 589, p. 244–47, graphs.)

Discusses the application of nominal cleavage strength as a practical factor in the interpretation of Charpy V-notch and yield-strength tests, with special attention to the initiation and propagation of fractures caused by external loads and welding stress on welded structures. Steel, it is emphasized, cannot have both a high nominal cleavage strength at low temperature and strong energy-absorbing properties on fracture at higher temperatures. Graphically presented, the requirements of the nominal strength curve for weld metal (steep curve) differs from that for steel (flat curve).

Text in Russian. ***Title tr.:*** On the characteristics of *Chosenia macrolepis* Ass. communities in the extreme northwest of the distribution area.

Reports on the ecology of the bryophyte *Chosenia macrolepis* found on the Kuramis River, a right tributary of the Lena (Kharaulakhskiy Range, 70°45′ N. 127° 45′ E.) in 1956, the northernmost locality known in Yakutia. About 40 herbaceous plants appear in the first stand of associated plants. The dominants of the northern variant of Chosenietum include *Anemone richardsonii, Galium boreale* and *G. verum.* ***Copy seen:*** DLC.

53636. NORIN, B. N. K poznaniiû semennogo i vegetativnogo vozobnovleniiâ drevesnykh porod v lesotundre. (Rastitel'nost' Krainego Severa SSSR i ee osvoenie, 1958. vyp 3, p. 154–244, illus., tables.) Over 160 refs. Text in Russian. ***Title tr.:*** On the generative

and vegetative reproduction of trees in the forest-tundra.

Reports results of studies on reproduction of *Larix sibirica, Picea obovata, Betula pubescens* and *B. tortuosa* carried out in the Nyda River basin on the Taz Peninsula ("Malyy Yamal,") in 1953–55 (cf. No. 47076). Literature on reproduction of forests in the far North of the U.S.S.R. and, partly, in northern Finland, is surveyed (p. 156–65); the geomorphology, soil and climate of area, 66°15′–66°45′ N. 72°50′–74°20′ E. are outlined; vegetation and typical plant associations of the forest tundra are described (p. 165–92). Tree reproduction by seed (p. 192–231) and vegetative (p. 231–38) is discussed in detail, covering all biological stages. The adverse climatic and soil conditions hamper all reproduction, but in the larch, seed gave better results, and *Betula tortuosa* favored the vegetative method. Similar studies are required in other regions of the U.S.S.R. for development of effective methods for afforestation of treeless tundras. The general index at end of the volume includes the plants cited in this paper. ***Copy seen:*** DLC.

53641. NORSK MYRSELSKAP. Meddelelser. *Oslo.* 1, 1903– , *in progress.* Text in Norwegian. ***Title tr.:*** The Norwegian Bog Association. Communications.

Issued in six numbers (approx. 30 p. each) a year, dealing with the investigation, improvement, and productivity of bogland. Articles are published on areal inventories; peat production, its heat content, drying methods, transport, household use, and commercial value; bog drainage, soil qualities, mineral content, afforestation and cultivation, fertilization, crop response; increase of agriculture and forest area, and soil conservation. Annual reports include statistics on production and sale of peat from individual provinces, allocation of public and association funds, etc. Information on the three arctic provinces of Norway which include substantial bogland areas, appears throughout. Articles of special arctic interest are abstracted under their authors' names in this Bibliography. ***File seen:*** DA.

53642. NORSK MYRSELSKAP. Her er saedejord nok. (*Its:* Meddelelser, Feb. 1957. årg. 55, nr. 1, p. 1–5.) Text in Norwegian. ***Title tr.:*** Here is seeding ground enough.

A general inventory is made of possibilities for increasing the cultivated area and agricultural production in Nordland, northern Norway. Intensive cultivation of berries, vegetables, potatoes, pasture, hay, and forest is discussed. Modernization of farms and agricultural education are required for men of the region who combine farming with fishing and forest work. Financing and transportation are critical factors in expanding Nordland agriculture. ***Copy seen:*** DA.

53643. NORSK MYRSELSKAP. Sitkagran i kyststrøkene. (*Its:* Meddelelser, Dec. 1955. årg. 53, nr. 6, p. 185–86.) Text in Norwegian. ***Title tr.:*** Sitka spruce in the coastal regions.

Alaska spruce planted from seed in Norway in 1923 and transplanted in 1927 to coastal locations in Nordland, is reported: In 1951 and 1954 fertile seed was gathered from these spruce which require good, moist soil, and high precipitation and air humidity. In windy locations they fare better than the native spruce. Annual growth and supervised planting are discussed. ***Copy seen:*** DA.

53644. *NORSK SKOGBRUK.* Fra landbruksdepartementet: småviltjakt i saerskilt matrikulerte statsskoger, jaktlovens § 18. (Norsk skogbruk, May 1957. årg. 3, nr. 10, p. 291.) Text in Norwegian. ***Title tr.:*** From the Department of Agriculture: small-game hunting in individually registered state forests, the Game Act, section 18.

This section gives the forest owner the right to limit the hunting season, methods, and licenses. The effect of the law in northern Norway, where much of the registered forest land is state owned, is discussed. ***Copy seen:*** DA.

53645. *NORSK SKOGBRUK.* Furufrøbeholdningen i Troms så godt som oppbrukt. (Norsk skogbruk, Oct. 1956. årg. 2, nr. 19, p. 620.) Text in Norwegian. ***Title tr.:*** Fir seed supply in Troms practically exhausted.

Increased production of seedlings by local nurseries combined with poor conditions for seed ripening over several years has caused a scarcity of fir seed in this part of northern Norway. Proposal is made to bring in seed from the Inari region of northern Finland.

Copy seen: DA.

53646. *NORSK SKOGBRUK.* Den nye naturvernloven åpner adgang til å opprette virkelige nasjonalparker i Norge; Børgefjellsområdet blir muligens vår første nasjonale villmark. (Norsk skogbruk, June 1955. årg. 1, nr. 3, p. 84–87, illus.) Text in Norwegian. ***Title tr.:*** The new law for protection of nature opens the way to establish real national parks in Norway; the Børge mountain region will possibly be our first national wilderness.

Discussion of the law and its intent with proposal that the first national park (approx. 1200 km.^{2}) be established in the Børge region on both sides of the southern boundary of Nordland province in northern Norway. ***Copy seen:*** DA.

53647. *NORSK SKOGBRUK.* Skogkultur og skogreising i 1956. (Norsk skogbruk, Jan. 1957. årg. 3, nr. 1, p. 13–14, table.) Text in Norwegian. ***Title tr.:*** Silviculture and reforestation in 1956.

Summary is given of forest cultivation and planting in 1955 and allocation of funds for 1956. Of the 73 million trees set out in 1955, 11.3 million were planted in north Norway, exceeding the planting planned to 1960. National support of the program is currently 75% of the total expenditure in that region.

Copy seen: DA.

53648. *NORSK SKOGBRUK.* Skogplanting på Grønland. (Norsk skogbruk, Sept. 1955. årg. 1, nr. 6, p. 230.) Text in Norwegian. ***Title tr.:*** Forest planting Greenland.

Planting of hardy conifers in southern Greenland is discussed and growth compared with that in Denmark. The seedlings were grown in northern Denmark, 15,000 having been supplied in 1953. But if forestry is to be developed in Greenland, the seedlings should be sprouted and grown there.

Copy seen: DA.

53649. *NORSK SKOGBRUK.* Skogplanting på 71 grader nord. (Norsk skogbruk, Apr. 1955. no. 1, p. 11.) Text in Norwegian. ***Title tr.:*** Forest planting at 71° N.

Notice of government decision to underwrite 75% of the cost of establishing a forest demonstration plot on the school-

grounds at Havøysund, West Finnmark. At present the island, Havøygavlen, is unforested. ***Copy seen:*** DA.

53650. *NORSK SKOGBRUK.* Sulfatfabrikk anlagt i Varanger. (Norsk skogbruk, Feb. 1957. årg. 3, nr. 3, p. 62.) Text in Norwegian. ***Title tr.:*** Sulphate factory in Varanger.

In Jan. 1957, Finnish and Norwegian delegations met in Oslo to discuss economic cooperation in utilization of forest resources of the Inari district of northern Finland. A sulphate cellulose factory in Varanger, northernmost Norway, development of the road system, and combined financing and management were considered. A joint commission is to study costs. Continuous operation, utilizing 30–40 thousand tons of forest production per year, is planned.

53652. NORTHCOTE, T. G. Effect of photoperiodism on response of juvenile trout to water currents. (Nature, *London,* May 3, 1958. v. 181, no. 4618, p. 1283–84, illus.) 2 refs.

Account of experiments with fingerlings kept at 10°, 15° and 20° C. and exposed to 8 hr. light and 16 hr. darkness or vice versa. The response to water currents varied considerably between the different groups depending largely on their preceding exposure to light. ***Copy seen:*** DLC.

53653. NORTHERN CANADA POWER COMMISSION. Annual report for the fiscal year ended March 31, 1957, 1958. Ottawa, 1957, 1958. 2 v. illus., maps incl. 1 fold. In sequence to No. 47095.

Summarizes operations of 1948–1958; reports on power produced at the Snare River, Fort Smith, Mayo River and Fort Simpson plants; construction progress on a 15,000 hp. hydroelectric plant at Whitehorse Rapids scheduled for completion in Nov. 1958 and a utility project at the new site of Aklavik (Inuvik) to be completed in May 1959; projects being considered at Moose Factory and Frobisher Bay; financial condition of existing plants with itemized statements. The 1957 report notes amendment to the Northwest Territories Power Commission Act, approved Aug. 14, 1956, changing the Commission's name, and enabling extension of its operations throughout Canada. ***File seen:*** DLC.

53654. *NORTHERN MINER.* Canada planning wide research on arctic continental shelf. (Northern miner, Dec. 11, 1958. v. 44, no. 38, p. 17, 21)

Describes plan for scientific parties to study the 1,500 miles of arctic continental shelf, under auspices of the Dept. of Mines and Technical Surveys. Topography and geologic character of ocean floor, underlying structures, sea water, fish and marine mammals, etc. are to be investigated; geophysical stations are to be set up at Alert and Mould Bay. Studies begin in 1959–1960 on a 300-mile area centered on Isachsen, Ellef Ringnes Island. Heavy equipment goes a year in advance by ship to Resolute, thence by air to Isachsen, other equipment and personnel by air from Churchill early in the spring field season.

Copy seen: DGS.

53655. *NORTHERN MINER.* Quebec proceeding on record program of geological work. (Northern miner, Aug. 21, 1958. v. 44, no. 22, p. 18.)

Lists geological field parties at work for Quebec Dept. of Mines during 1958. Of 49 projects, eight are in the Ungava area, three are in the Mt. Wright-Mt. Reed region. Continuing examination of mineral prospects and investigation of water supply problems are also part of the program. ***Copy seen:*** DGS.

phage production of *Bacillus megatherium*. (Journal of general physiology, May 1957. v. 40, no. 5, p. 653–61, illus.) 23 refs.

Account of experiments which showed that exposure to ultraviolet rays produces a toxic (mutagenic) substance inside the bacterial cell. This substance is inactivated by white light. Lysis due to UV exposure is prevented by white light, provided the exposure to UV is brief. ***Copy seen:*** DNLM.

53657. NORTON, EDWARD. Catalogue of the described Tenthredinidae and Uroceridae of North America. (American Entomological Society. Transactions, 1868. v. 1, p. 31–84, 193–280.)

Includes at least 15 species native to Alaska and northern regions of Canada. ***Copy seen:*** DA.

NORTHWEST TERRITORIES POWER COMMISSION. *See* Northern Canada Power Commission.

53658. NORWAY. FISKERIDIREKTORATET. Årsberetning vedkommende Norges fiskerier. Bergen, 1894– , *in progress*. Issued by Departementet for det indre 1894–1899; Norges fiskeristyrelse 1900–1905; subsequently by Fiskeridirektoratet. Text in Norwegian. ***Title tr.:*** Annual report of the Norwegian fisheries.

Basic work. *Includes* information and statistical data on catch of commercially important species, fishing conditions and catch results according to provinces or fishing grounds. Regulations, shipping, administrative activities, hatchery reports, finances etc. are reported each year, together with a summary of general conditions and results. Topical and research reports are included, and those of arctic interest are described in this Bibliography under the authors' names. ***Copy seen:*** DLC.

53659. NORWAY. FISKERIDIREKTORATET. Norges fiskerier, 1884– , *in progress*, since 1952 *pub.* in Bergen. Issued yearly in approx. 100 pages, 8 vo., tables. Text in Norwegian. Summary in English. ***Title tr.:*** Norway's fisheries. Produced in the series Norges offisielle statistikk (Official statistics of Norway) during the period 1884–99 by Statistisk sentralbyrå (Central office of statistics) and subsequently by the director of fisheries.

Includes data and information on the fishing off north Norway, East and West Greenland, Bjørnøya and Spitsbergen and in the Barents Sea: cod, halibut, herring, small whales, seals, etc.

File seen: DLC.

53660. NORWAY. GEOFYSISKE KOMMISJON. Geophysical research in Norway 1955–56, 1956–57. Bergen, John Grieg, 1957, 1958. 20, 21 p. (*Its:* Annual report, no. 6, 7.)

Reports work of 15 organizations and institutions for the period July 1, 1955–June 30, 1957, as for previous years (No. 36500, 47096). New observation stations, research cruises, and extraordinary observations are noted, also work in northern Norway, Svalbard, Bjørnøya, Barents and Greenland Seas, and Norwegian coastal waters. Regular publications of these organizations and individual papers published during the report period, are listed. ***Copy seen:*** DGS.

A preliminary report on author's linguistic field studies during her 1953 scientific mission to Yakutia. Of particular interest were the westernmost (Sakkyryr) dialects spoken along the right tributaries of the Lena and in the Yana River basin. These dialects are so divergent from the eastern Eveny or Tungus, basis of the established literary language, that development of a second literary language was petitioned for (unsuccessfully) in 1953. Few grammatical discrepancies were found among all dialects; though phonetic and lexic differences are (in some cases) considerable, the accepted literary language can be understood by most Eveny except those speaking the Sakkyryr dialects. In its 25 years' existence, the literary language has gained little acceptance as spoken language and has not affected the use of local dialects. A division of the Eveny dialects into eastern, western and westernmost (Sakkyryr) is suggested. Most Eveny of Yakutia speak also Yakut but only few know Russian.

53671. NOWOSAD, F. S. Agricultural research in sub-arctic and arctic Canada. (Canadian geographical journal, Sept. 1958. v. 57, no. 3, p. 100–103, illus.)

Discusses agricultural possibilities on the basis of findings at the Dept. of Agriculture's experimental sub-stations. Results obtained with field and horticultural crops, livestock and poultry at Mile 1019, Alaska Highway (60°45′ N. 137°35′ W.) in Yukon Territory, and with field and horticultural crops at Fort Simpson, Mackenzie District (61°52′ N. 120°21′ W.) are given. The Fort Simpson sub-station is supervising the landscape and garden work at East 3 (Inuvik), the new townsite of Aklavik: two–three years' cultivation are required before permafrost recedes sufficiently for successful growth. The use of plastics for constructing greenhouses and cold frames is under study at the Fort Chimo sub-station in northern Quebec. Possibilities of raising sheep, domestic geese of the Pilgrim brand, and hens are being investigated, also reclamation of the False River tidal flats for agricultural use.

53674. NUSSER, FRANZ. Distribution and character of sea ice in the Euro-

pean Arctic. (*In:* Arctic Sea Ice Conference. Proceedings, 1958. p. 1–10, 5 text maps.) 14 refs.

"Sea ice conditions are examined individually for the East Greenland-East Spitsbergen area and the North and Baltic Seas. The ice of the North Polar Sea and that of the East Greenland Current has the same place of origin and owes its formation to the constant cold polar climate. The ice of the North Polar sea forms a pack-ice cover several years old, which belongs to the 'inner polar type' (of Büdel). The ice of the East Greenland and East Spitsbergen Currents is advective ice of the 'polar oceanic type', and although it is still polar ice carried to the South, it can no longer form pack-ice covers due to the strong currents. Bay and fjord ice of the east coast of Greenland represents local ice of the 'polar bay type.' Another form of ice, the 'polar border sea type' is found in the Barents Sea; it is local in origin. Ice in the North and Baltic Seas owes its formation to the strong cooling of the continent and is a seasonal phenomenon with winters rich in ice alternating with those free of ice, depending not so much on temperature depression as on single periods of cold. Types of ice found in these seas, depending on climate, include the 'full maritime type,' and 'half maritime type,' and various transition types."—SIPRE.

53681. NYGREN, AXEL, 1912– . A cytological and embryological study of *Antennaria porsildii.* (Hereditas, Oct. 13, 1950. bd. 36, häfte 4, p. 483–86, 7 illus.) 17 refs.

Contains historical notes on this plant from the Pältsa district in northernmost Sweden and the results of its cultivation in a place only a few miles from its natural locality on Mt. Moskana. The number of chromosomes is 2n=63. A closely related *A. glabrata* has the same number, both probably originated from *A. alpina* with 2n=42. The variation within *alpina* is so great that it will permit the formation of *glabrata* as well as *porsildii.* ***Copy seen:*** DLC.

53682. NYGREN, AXEL, 1912– . Experimental studies in Scandinavian alpine plants, I; ecotypical differentiation in *Melandrium angustiflorum* (Ruprecht) Walpers. (Hereditas, 1949. bd. 35, häfte 2, p. 215–20, 7 illus., table.) 9 refs.

Contains a table of measurements of different morphological characters in *M. angustiflorum* cultivated from seeds collected in Björkliden in Swedish Lapland (68°30′ N.), and from the Alta district of northern Norway (70° N.). The two types are so different that they deserve the rank of subspecies. From the genetical and ecological viewpoints, the Alta type is an "alpine lowland ecotype of *M. angustiflorum,* and the Björkliden population a mountain ecotype of the same species. The chromosome number of both species is 2n=48, and both have a regular meiosis.

53683. NYGREN, AXEL, 1912– . Experimental studies in Scandinavian alpine plants, II; on the origin of the Greenlandic species *Melandrium triflorum* (R. Br.) J. Vahl. (Hereditas, 1951. bd. 37, häfte 3, p. 373–81, 16 illus.) 12 refs.

Contains a study of the taxonomy and origin of three *Melandrium* species in Greenland: *furcatum, apetalum* and *triflorum.* In 1948 the author crossed two ecotypes (from Alta in northern Norway, and Björkliden in Swedish Lapland) of *M. angustiflorum* with *M. apetalum* and *M. rubrum.* The hybrid plants of the first combination flowered in 1950 and they looked morphologically as intermediate between the parent plants. Outside Scandinavia *M. triflorum* comes nearest to the new hybrid. The chromosome numbers of Greenland species are: *M. furcatum:* 2n=48; M. *apetalum:* 2n=24, and *M. triflorum:* 2n=72. The problem of *M. triflorum* needs further cytological study and experimental crossing. ***Copy seen:*** DLC.

53684. NYGREN, AXEL, 1912– . Experimental studies in Scandinavian alpine plants, III; intra- and interspecific crosses in *Melandrium furcatum* (Raf.) Hultén subsp. *angustiflorum* (Ruprecht) Walpers. (Uppsala. Lantbrukshögskolan. Annaler, 1957. v. 23, p. 405–411, 34 illus. 2 tables.) 6 refs.

It is possible to cross *Melandrium* species of different sections with each other. The hybrid between *M. apetalum* (L.) Frenzl. and *M. angustiflorum,* produced earlier was completely sterile, as was the hybrid *M. angustiflorum* and *rubrum.* But a cross between *Lychnis flos cuculi* L. and *M. rubrum* has given rise to a hermaphrodite, fertile, sex-segregating hybrid, showing the impossibility of predicting the fertility of the F_1, in a cross between different species in the carnation family. The material for this study was collected at Björkliden close to Abisko (68°30′ N.) in Swedish Lapland, and in the Alta district of northern Norway (70° N.). ***Copy seen:*** DLC.

53685. NYGREN, AXEL, 1912– . A fertile hybrid *Lychnis flos cuculi* and *Melandrium rubrum* and its sex segregating offspring. (Uppsala. Lantbrukshögskolan. Annaler, 1957. v. 23, p. 413–21, 36 illus.) 8 refs.

A study of a hybrid between the hermaphroditic *L. flos cuculi* (2n=24) used as mother and the dioecious *M. rubrum* (2n=24), which produced seeds for 21 F_2 plants (of which seven males, five females and one intersex flowered in 1957). The Y chromosome from *M. rubrum* is present in the second generation males. The father type of *M. rubrum* came from Alta in northernmost Norway (70° N.).

Copy seen: DLC.

53686. NYGREN, AXEL, 1912– . The genesis of some Scandinavian species of *Calamagrostis.* (Hereditas, 1946. bd. 32, häfte 2, p. 131–262, 235 illus., tables.) 158 refs.

Contains a cytological study of eight species of this grass genus (six from Lap-

511326—60——54

land), both amphimictic and apomictic. Of the amphimictic species, *C. arundinacea, canescens, neglecta* and *varia* are all tetraploid (2n=28), while *epigeios* is tetraploid, hexaploid or octoploid; the amphimictic species are predominantly cross-fertilized. The apomictic species are: *C. chalybaea* (2n=42), *C. purpurea* (2n=56–91) and *C. lapponica* (2n=42–112); the last occasionally forms pollen. *Calamagrostis* apomicts seem to occur solely in the Northern Hemisphere; they have an arctic-subarctic distribution. *C. canescens* is assumed to have had an extensive distribution in the Northern Hemisphere during the Tertiary period, and *C. canadensis, C. langsdorffii* and *C. purpurea* to have arisen from it in the earlier phase of the Quaternary. Apomixis within the genus (as *C. purpurea*) is due to intra- and inter-specific hybridization in combination with polyploidy.

Copy seen: DLC.

53687. NYGREN, AXEL, 1912– . Investigations on North American *Calamagrostis*, I. (Hereditas, 1954. bd. 40, häfte 3–4, p. 377–97, 93 illus., text map.) 3 refs.

Chromosome numbers of 19 species of these grasses are determined, of which *C. nutkaensis* (tetraploid, 2n=28) ranges from the Aleutian Islands to southern California, and *C. purpurascens* (2n=40–42, 47–50, 53–57) occurs in northern Siberia, from Alaska and the Yukon south to California, and east to Baffin Island and Greenland. Most North American species are restricted to small areas with a low number of plants; they are no doubt expiring species. The most successful species are *C. canadensis, inexpensa, purpurascens* and *rubescens*.

53688. NYGREN, AXEL, 1912– . A preliminary note on cytological and embryological studies in arctic Poae. (Hereditas, 1950. bd. 36, häfte 2, p. 231–32.) 3 refs.

Summarizes author's five-year study of *Poa* species (grasses) in the northern Scandinavian mountains. Viviparous *P. alpina* forms pollen and may cross with other *P.* species. *P. laxa* ssp. *flexuosa* constitutes in Scandinavia a sexual and autogamous species with 2n=42. *P. arctica* is very polymorphous and has chromosome numbers running from 2n=39 to 2n=92; three subspecies are recognized in northern Scandinavia: *caespitans, microglumis* and *tromsensis;* the last one was not investigated. *Microglumis* has chromosome numbers varying between 2n=68 and 2n=82, *caespitans* has 56 chromosomes somatically and does not form any pollen. The innumerable number of viviparous and non-viviparous arctic *P.* forms originated after crosses between apomictic, facultatively sexual, and sexual types, in the later generations of which new sexual and apomictic forms have arisen.

53689. NYGREN, AXEL, 1912– . Studies on vivipary in the genus *Deschampsia*. (Hereditas, 1949. bd. 35, häfte 1, p. 27–32, illus., table.) 15 refs.

Contains results of experimental study of *D. caespitosa* and *D. alpina* and some species of *Festuca* and *Poa* from material collected in different biotypes in the Dovre Mts. (62° N.) and Abisko, Torne Lappmark (68° N.), and cultivated at Uppsala (60° N.). The plants were exposed to light for eight hours (7 A.M.–3 P.M.) daily during May–June. Only the northernmost biotype of *D. caespitosa* was affected in the direction of vivipary, and such forms as had an already fixed vivipary preserved this even after the treatment. In all plants the development was delayed in comparison with the control plants in normal daylight at the latitude of Uppsala. *D. alpina* includes the polyploid series 2n=36–39–52. The basic number is 13.

Account of investigation of heart-lung preparations of dogs made hypothermic to 27°–28° C., with fibrillation induced by faradic stimulation; 50% fructose in Ringer-Locke, combined with cardiac massage restored heartbeat. Except for serum potassium and reducing sugar concentrations, there were no significant chemical or functional changes following the treatment. ***Copy seen:*** DLC.

53694. OBRUCHEV, SERGEĬ VLADIMIROVICH, 1891– . Po goram i tundram Chukotki; ėkspedit͡siia 1934–1935 gg. Moskva, Gos. izd-vo geogr. lit-ry, 1957. 198 p. illus., plates, fold. col. map. Text in Russian. ***Title tr.:*** In the mountains and tundras of Chukotka; an expedition in 1934–1935.

Popular account of the expedition headed by the author, which explored the Chaun Bay region and Chaun River basin: the party (by steamship from Vladivostok) established a base at Pevek (69°45′ N. 170°20′ E.) Aug. 1934; made boat trips to Ayon Island and the shores of Chaun Bay; winter trips by reindeer and propeller sled, summer trips by boat, canoe and foot to the upper reaches of the Chaun River and its tributaries and to the Northern Anyuy Mountain Range and the Anadyr' Plateau (cf. map). Propeller sledges were preferred to the reindeer provided by the Chukchis, even in mountainous areas. The life of the Chukchis is depicted vividly and in detail: the social and family relations, position of women, construction of dwellings (yarangas), food, clothing, hospitality, etc., their seasonal migrations with the reindeer herds and the work of the Russian "migratory" teachers who accompanied them are described. Obruchev's party carried out geographical, geodetic and geological explorations of the then little known area of the Chaun depression and its borders, and discovered tin deposits. Further development of the Chaun region and of Chukotka generally is reviewed in conclusion (p. 194–97): Pevek has become a tin production center; the Chukchi economy has been collectivized, hospitals, schools, etc. have been established. Fold. col. map (1 cm.=15 km.) shows that party's travel routes. The scientific results of the expedition were reported in 1938, by Obruchev, M. I. Rokhlin and A. G. Kovtun (No. 9200, 9201, 12662, 14759 and 14763). ***Copy seen:*** DLC.

Geologiska undersökning, ser. Ca., Avhandlingar och uppsatser, nr. 41.) 126 refs. Text in Swedish. Summary in English. ***Title tr.:*** Description to the map of the Precambrian rocks of Norrbotten county.

The Precambrian covering some 31,815 sq. mi. in Sweden's northernmost province is divided into two major formations, the Svionian (older) and the Karelian cycles. The Svionian is believed to be of the same age as the basement formations in central Sweden and southwest Finland. Age determinations indicate that this cycle terminated about 1,800 million years ago. The Karelian cycle marks the end of the Archean in Fenno-Scandinavia and is considered to be about 800 million years old. The detailed stratigraphy of the Precambrian in Norrbotten is shown (table). The region is described in detail and compared with neighboring Precambrian areas. A survey of ore and mineral deposits is given. A list of place names is appended. In pocket, is the map (for which this description was prepared) at scale 1:400,000: it was compiled, mainly by the author and assistants, during 1940–1955. Some of Ödman's interpretations are discussed critically by P. A. Geijer, q.v. ***Copy seen:*** DGS.

Account of experiments with dog skin frozen and thawed *in situ* or when isolated, and subsequently transplanted. Assessment of survival of the transplants suggests severe, irreversible damage to the isolated tissue. Cold injury to the skin *in situ* was not severe but secondary sequelae due to vascular changes caused extensive necrosis. ***Copy seen:*** DNLM.

53710. OGLESBY, JOSEPH E. When science called, the U.S. Navy built seven bases at the end of the earth. (Contractors and engineers, Oct. 1957. v. 54, no. 10, p. 24–29, illus.)

Describes constructional features of bases established in the Antarctic during operations Deepfreeze I and II. Designed to withstand winds of 100 mph., snow loads of 125 lbs./ft.², and temperature differentials of 190° F., the standard 20 x 48 ft. building consists of 4 x 8 ft. panels for flooring, walls and roofing, lined on the inside with an aluminum vapor barrier and joined by metal clips. A void stuffed with Fiberglas provides insulation between the inside aluminum panel and the outside plywood; roof panels are supported by high-tensile steel or aluminum roof joists. At land bases (3), the floor panels rest on wooden sills, while buildings constructed on ice (4) were set on high-tensile steel or aluminum saddle trusses. Skylights, 4 x 8 ft. each, triple layers of glass with air pockets between panes, were fitted. Construction of access tunnels, snow-melter installations, and towers for antennas and observation posts, is described; operational procedures in site surveying and equipment transportation are briefly outlined. ***Copy seen:*** DLC.

Issue of a popular magazine, devoted to northern problems of the U.S.S.R. A general survey of development of the North, by M. P. Tarasov, Chairman of Presidium of Supreme Soviet of the R.S.F.S.R. introduces over 25 articles and notes on Soviet industrial, economic and cultural expansion in arctic and subarctic regions, including sketches of life and work in Kola Peninsula, in the towns of Ukhta, Vorkuta, Igarka, Noril'sk, Yakutsk, Magadan, at the Cape Chelyuskin polar station, on the diamantiferous fields of Yakutia, on a drifting station in the Arctic Basin, and so on. Despite their popular character, these articles offer useful information, as for instance, on education (technical school in Noril'sk, university in Yakutsk, boarding school in Neksikan), mining (gold in Kolyma basin, coal at Vorkuta). Living conditions in the far North are so lauded as to suggest that the purpose of this special issue is to attract youth to the North, suffering from shortage of manpower. Most of the articles are described in this bibliography under their authors' names: M. P. Tarasov, D. I. Shcherbakov, S. Fridlîând, M. Bondarenko, P. Manuĭlov, E. I. Rîabchikov, S. Osipov, M. Zlatogorov, B. Bablûk, O. Babin, S. T. Morozov, M. Tikhonov, ĭŪ. Rîabov, T. Timofeev, S. Mesîat͡sev, S. Lûsin, B. I. Shovrin, V. Pekelis, O. Babin, E. Villakhov, S. Fedorov, F. Shipilov; others, anonymous, are:

Radiogramma s samoĭ severnoĭ tochki Azii (Radiogram from the northernmost point of Asia), p. 8: brief note on the radiometeorological central station on Cape Chelyuskin and text of a radiogram from its chief, F. K. ĭŪzefovich, about weather conditions, daily work, radio, air transport, etc. Work of several of the personnel who completed studies in the Leningrad Higher Arctic School, is mentioned.

Na chukotskom poberezh'e (On Chukotka shores), p. 15: notes work of the Khabarovsk artist, Vasiliĭ Evgen'evich Romanov, a series of drawings and paintings on northern subjects; two of his drawings on Chukchi hunters' life are reproduced.

Pechorskaîâ magistral' (Pechora trunk line), p. 21: note and illus. on the direct Vorkuta-Moskva railroad trip of two-and-a-half days which replaces the former tiresome journey from Vorkuta to Ust'-Vorkuta, thence by steamers to Nar'yan-Mar and Arkhangel'sk. The Pechora railroad is to become a double-track line in the current five-year period.

Na st͡senakh teatrov (On theater stages), p. 25: notes, with illus., on theaters in Magadan, Syktyvkar, Yakutsk and Murmansk.

Dva brata i bogach; Chukotskaîâ skazka (Two brothers and a rich man; a Chukchi tale), p. 31: Translation of a

propaganda tale about two reindeer herders taken from *Tales of the northern peoples*, 1956, published in Magadan.

Notes first Scandinavian Air Lines flight Copenhagen to Tokyo via the North Pole, Feb. 24, 1957.

Copy seen: DLC.

53713. OGUTI, TAKASI. Notes on the morphology of *SC*. (Tokyo University. Geophysical Institute. Geophysical notes, June 1956. v. 9, no. 1, p. 81–90, diagrs., map, table.) 11 refs.

World-wide simultaneous records of *SC* variations are examined, and the equivalent current-systems for the beginning, intermediate, and final stages are illustrated. Each current-system seems composed of two parts; a dipole-like current-system near the geomagnetic pole, and the zonal current part corresponding to the world-wide increase in the horizontal component of geomagnetic field. The dipole seems to rotate clockwise during the course of rapid *SC* variation, and its direction at the final stage becomes opposite to that at the start. This systematic change may be the cause of the systematic dependence of type of *SC* traces on magnetograms on local time, and of the particular distribution of the preliminary reverse impulse of *SC*.

Copy seen: DLC.

53714. *OIL IN CANADA.* Northern push emphasizes need for muskeg conquest as activity drops. (Oil in Canada, Aug. 4, 1958. v. 10, no. 40, p. 30–32+, illus., 2 text maps, diagrs.)

Reviews leading phases of muskeg research, and includes four papers read at the 1958 National Research Council of Canada muskeg conference, as listed below. A new method of seismic exploration in muskeg territory is reported; several types of exploration vehicles suitable for snow, swamp, and muskeg are illustrated and described. Access is the major problem of engineers and scientists in relation to muskeg, or organic terrain. There is a steady decline of exploration in muskeg areas which may be offset by an increase in winter activity.

Thomson, J. G. Vehicle mobility performance in muskeg, a preliminary report (p. 40–43, 4 diagrs.). *Describes* methods and results of performance tests on tracked vehicles operating in muskeg Oct. 1957. Standard test method applied in other media, such as sand, clay, and snow, was used. Conclusions based on limited data are given; test procedure was considered adequate for mobility testing of vehicles in muskeg.

Keeling, L. Some aspects of the terrain problems in northwestern Canada (p. 44–48, 5 text maps). *Describes* briefly, efforts in oil exploration; some problems created by terrain conditions are stated and illus. by maps; exploration methods used by Imperial Oil Co. personnel are outlined. Present need of ground studies and lack of air recognition of cover classes or form patterns, are stressed.

Hemstock. R. A. Muskeg in Canada (p. 50–53). *Notes* importance of Canada's 500,000 sq. mi. of muskeg to agriculture, transport, and development of natural resources.; presents problems of vehicle design, and of devising techniques for operating in muskeg. Future developments are indicated, including use of aircraft, helicopters, and automation; year-round preliminary operations are possible, with careful planning.

Palmer, R. L. Weight dropping on frozen muskeg, a new means of seismic exploration (p. 54–54B, illus., diagr.) *Describes* equipment, methods, procedure, and results of weight dropping technique, used in Canadian seismic exploration in Feb. 1957 and Nov. 1957–Mar. 1958. Already used in the United States and Algeria, the technique is rapid and inexpensive; a three-ton weight, dropped nine feet, imparts a seismic signal into the ground. ***Copy seen:*** DGS.

53723. OKHOTNIKOV, V. N. Ledniki na Polârnom Urale. (Vsesoûznoe geograficheskoe obshchestvo. Izvestiía, Mar.–Apr. 1958. t. 90, vyp. 2, p. 174–76, illus.) 2 refs. Text in Russian. ***Title tr.:*** Glaciers in the Polar Ural.

Presents briefly 1954 observations of the Malokarskiy and Vostochnyy glaciers south of Maloye Shchuch'ye (approx. 66°50′ N. 66°05′ E.) by the author, P. P. Gerdvil, and IU. A. Korĭakin. Location, thickness, firn development, direction of movement and development of moraines are outlined. The observations are considered to supplement the work of K. I. Postoev and A. V. Khabakov. ***Copy seen:*** DLC.

53724. OKKO, VEIKKO OMA TOIVO, 1912– . Die Tonvorkommnisse und die Ziegelindustrie in Finnland. Helsinki, 1957. 50 p. illus., maps. (Fennia, 1958. 81, no. 3.) 31 refs. Text in German. ***Title tr.:*** The occurrence of clay and the brick industry in Finland.

The brick and other clay products industry is surveyed with reference to

the nature, quality, and location of clays; and to economic factors: fuel, manpower, local and distant markets, mechanization, and transportation. The clays of Finland are geologically described and their relative values considered. Wood, the commonest firing fuel, is abundant throughout the country. Manpower also is not important as a site factor (mechanization offsetting rural labor decreases), nor is urban location. The important site factors appear to be abundance and quality of clay, availability of transport, and locally, proximity to a sawmill. In northern Finland, though lean clays of the inland lakes and fuel wood are available, brick is transported from the south despite the demand in postwar reconstruction. Transportation is generally by highway, sometimes by rail as in the case of a small regional center like Rovaniemi which receives brick from several locations in southern Finland. ***Copy seen:*** DLC.

53725. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Ancient cultures and cultural and ethnic relations on the Pacific coast of north Asia. (International Congress of Americanists, 32nd. *Copenhagen*, 1956. Proceedings, 1958, p. 545–56, illus.)

Deals with Soviet field work of the last 25 years along the Pacific coast, including the Bering-Okhotsk Sea region, and the discovery of ancient Eskimo cultures on the Asiatic mainland. S. I. Rudenko's 1945 investigations of the Bering Strait area revealed widespread traces of the Okvik, Old Bering Sea, Punuk and Thule stages; Birnirk stage artifacts were found in 1946 by A. P. Okladnikov and D. V. Zaporozhskaĭa at Cape Baranov. M. G. Levin excavating in the Magadan region on Ol'skiy Island (Zav'yalova Island) in 1934 discovered bone and stone objects similar in appearance to some ancient Aleutian finds described by V. I. Jochelson (No. 8130). Pre- or early neolithic finds, especially a polyhedric obsidian tool of the so-called core scraper type, found on the Tigrovaya River near Vladivostok, are similar to implements belonging to the upper paleolithic stratum in Eastern Siberia and the Transbaykal region. They are also common in Mongolia and have been found on the campus of the University of Alaska at Fairbanks. These finds add weight to N. C. Nelson's views (No. 30965) on the existence of cultural ties between Central Asia and northern North America. The stone-age settlements on Ol'skiy Island and Koni Peninsula (northern Okhotsk Sea shore) were probably abandoned at latest in the 18th century (they lack Russian imports), and belonged to the ancient Koryaks who were driven out of this area in the mid-18th century by advancing reindeer-herding Evenki (Tungus). The excavation of a men's house similar to the Eskimo *kashim* and Chukchi *valkar* on Cape Tetyukhe is noted, also the discovery (in shell-mounds near Vladivostok) of flat points with one or two holes drilled at one end, exactly like harpoon-blades used by ancient Eskimos.

53726. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Arkheologicheskie issledovaniĭa na Angare, 1936 g. (Sovetskaĭa arkheologiĭa, 1937, no. 4, p. 319–22, illus.) Text in Russian. ***Title tr.:*** Archeological investigations on the Angara River in 1936.

A report on the 1936 phase of the archeological excavations in the Angara basin sponsored by the Irkutsk Museum. Continuing the work begun in 1932–1934, the four-man party traveled 600 km. by boat from Irkutsk to Bratsk, investigating both river banks. The discovery of the paleolithic site at Buret' and the find of a carved ivory female figure with engraving of a fur garment are mentioned. Late neolithic burials of the Glaskovo and Kitoy stages and late neolithic or early iron age (7th–10th century A.D.) settlements were excavated. The prone and recumbent skeletons, single and multiple burials, polished stone and bone artifacts, ornaments, etc., are described. The preponderance of fishing over hunting implements (bronze, copper, bone) in the Angara Glaskovo stage is noted. ***Copy seen:*** DLC.

53727. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Arkheologicheskie issledovaniĭa v 1955 g. na Dal'nem Vostoke. (Akademiĭa nauk SSSR. Institut istorii material'noĭ kul'tury. Kratkie soobshcheniĭa, 1958. vyp. 71, p. 109–118, illus., sketch map.) Refs. Text in Russian. ***Title tr.:*** Archeological investigations of 1955 in the Far East.

Describes excavations of neolithic sites in the Maritime Province, and mentions (p. 111) the discovery, at the Tetyukhe River mouth, of several rectangular semi-subterranean dwellings. One of

them, containing a central hearth enclosed by two tiers of platforms or benches (nary), was used as a workshop for the manufacture of stone implements including dart points and harpoon heads. It closely resembles the 18th–19th century men's houses of northern Asia and America. ***Copy seen:*** DLC.

53728. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Arkheologicheskie raskopki na Angare i za Baĭkalom. (Akademiîa nauk SSSR. Institut istorii material'noĭ kul'tury. Kratkie soobshcheniîa, 1953, vyp. 51, p. 16–22, illus.) Text in Russian. ***Title tr.:*** Archeological excavations on the Angara and beyond the Baykal.

Reports on the results of the 1951 expedition of the Institute of the History of Material Culture in cooperation with the Institute of Culture of Buryat-Mongol A.S.S.R. and the Irkutsk and Buryat-Mongol Regional Museums (cf. No. 50168). Two group-burial complexes were excavated at Verkholensk: one late neolithic (Glazkovo), the other belongs to the transitional stage between Isakovo and Serovo forming a link between these two neolithic periods and is the first Isakovo site discovered in the Lena basin. Axes of middle Lena type (Vilyuy and Yakutsk area) found in Verkholensk's Isakovo horizon, confirm the early dating of the middle Lena neolithic age. Several habitation sites on the upper Angara and an Angara island yielded inventory of stone, bronze and early iron ages. A bronze knife belonging to the Glazkovo stage shows that bronze was already well-known in the Angara area during the late neolithic period. A Kitoy stage steatite fish lure (illus.), the first such find in Siberia, closely resembles lures widely used by ancient Algonkians in North America (cf. No. 53732). Genetic cultural ties of the early iron age linking the Yakuts, Buryats and Yeniseian "Paleoasiatics" are discussed. ***Copy seen:*** DLC.

53729. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– , *and* A. P. PUMINOV. Drevneĭshie sledy cheloveka na r. Olenek. (Problemy Severa, 1958, vyp. 1, p. 354–59.) 4 refs. Text in Russian. ***Title tr.:*** The oldest traces of man on the Olenek River.

Discusses junior author's discovery of two neolithic camp (?) sites on elevated (11–35 m.) river terraces (approx. 69° N. 119° E.) during his summer 1955 survey of Quaternary deposits in the Olenek River basin for the Institute of Geology of the Arctic. The geological formation of the river banks and the mammoth, musk ox, etc. bone finds point to a late-glacial or post-glacial terrace formation. The flint and slate artifacts consisting of roughly hewn nuclei, chipped lamellar blades and flakes are described. A fragment of a well-formed, lozenge-shaped, faceted knife blade with a minutely retouched handle is compared with similar finds (dated into the Isakovo-Serov stage) made near Zhigansk and at Siktyakh on the lower Lena River (cf. No. 47160). The importance of these Olenek River finds is stressed: dating possibly from 3,000 B.C., in an area previously considered uninhabited until the iron age. ***Copy seen:*** DLC.

53730. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– , *and* I. S. GURVICH. Drevnie poseleniîa v del'te r. Indigirki. (Akademiîa nauk SSSR. Institut ėtnografii. Kratkie soobshcheniîa, 1957. vyp. 27, p. 42–51, illus., map, diagr.) 8 refs. Text in Russian. ***Title tr.:*** Ancient settlements in the Indigirka River delta.

Discusses the bone, stone and ceramic finds made along Uralova Channel and Lake Tat'yanino in this delta region (approx. 72° N. 145° E.) on the Yakut A.S.S.R. coast. Accidental finds by local residents, in 1950–51, prompted an ethnographic expedition of the Institute of Language, Literature and History of the Academy of Sciences' Yakut Branch, headed by I. S. Gurvich in 1952, also investigations by A. N. Tolstov in 1953 while on the Permafrost Institute of the Academy of Sciences' expedition. The predominance of cloudy-white and smoky-orange chalcedony flakes and the relative scarcity of finished artifacts among the lamellar blades, scrapers, burins, adzes, arrow points, etc., are noted. Flint, though rarely used, is of highest quality, milky-white, thin and translucent. The round-bottomed ceramic vessels decorated with pseudo-textile checkered or rhombic netting found at Lake Tat'yanino are similar to finds made on the middle Lena and belong to the late neolithic or early bronze age of Yakutia, i.e. late second or early first millennium B.C. The Uralovo channel site, older, similar in some respects to the Serovo period of the Lake Baykal region, is tentatively dated into the first half of the second millennium B.C. Both sites are

attributed to paleo-Yukaghirs, an assumption corroborated by 17th century sources placing nomadic Yukaghir groups in an area extending from west of the Lena to Chukotka. ***Copy seen:*** DLC.

53731. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Iz istorii ėtnicheskikh i kul'turnykh svîazeĭ neoliticheskikh plemen Srednego Eniseîa; k voprosu o proiskhozhdenii samodiĭskikh plemen. (Sovetskaîa arkheologiîa, 1957, no. 1, p. 26–55, illus.) Over 50 refs. Text in Russian. ***Title tr.:*** History of ethnic and cultural ties of neolithic tribes of the middle Yenisey; the problem of the origin of Samoyed tribes.

Discusses the neolithic discoveries made in the mid-Yenisey region and compares the stone artifacts and pottery with the Angara-Lena and Ural finds, in an attempt to elucidate the problem of the origin of the Ugro-Finnish Samoyed tribes. The style, shape and material (nephrite, Angara slate) of stone implements point to a homogeneity between the neolithic culture stages of the mid-Yenisey (Krasnoyarsk) region and the Serovo, Kitoy and Glazkovo periods of the Angara, Lena and Lake Baykal area; yet other features, among them the style and characteristic shaping of human and animal statuettes and, particularly, the close-set hole-comb ornamentation and predominantly oval shape of the ceramic vessels, show a strong analogy to the neolithic finds made in the Urals and as far west as Karelia and Finland. The similarity between the mid-Yenisey and west Siberian artifacts, too great to be the result of merely cultural contacts, can be explained only by an eastward movement of Uralic tribes. These tribes, probably the direct ancestors of the Ostyaks, Voguls and Samoyeds, migrated from their original homeland in the forest and forest steppe area of the Urals and reached the mid-Yenisey-Sayan region during the neolithic or even paleolithic age. They may be thus responsible for the Europoid traits in the otherwise Mongoloid population of the Lake Baykal neolithic period. After the introduction of reindeer-herding, the Samoyed tribes abandoned the Yenisey-Sayan region moving northwestward into areas better suited for their new economy.

53732. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Kamennye ryby. (Sovetskaîa arkheologiîa, 1936. no. 1, p. 215–45, illus., sketch map.) 16 refs. Text in Russian. Summary in French. ***Title tr.:*** Stone fishes.

Describes neolithic fish sculptures, found in great number along the upper Angara and Lena Rivers. Frequent in the Serovo period, they seem non-existent in the late neolithic (Kitoy and Glazkovo) and belong to a cultural stage characterized by a hunting rather than fishing economy. Their occurrence appears to be in inverse relation to the development of fishing. Author discounts their use as cult objects and suggests an, as yet undetermined, practical function. ***Copy seen:*** DLC.

53733. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Nekotorye voprosy izucheniîa verkhnego paleolita SSSR v svete novelshikh issledovaniĭ. (Sovetskaîa arkheologiîa, 1954. t. 21, p. 5–29, illus.) Refs. Text in Russian. ***Title tr.:*** Some problems relating to the study of the upper paleolithic in U.S.S.R. in the light of the most recent investigations.

Includes (p. 20–29) the settlements along the Angara (Mal'ta, Buret'), Yenisey and Lena Rivers. The technique of stone chipping and flaking is identical with other Asiatic and European paleolithic sites. Theories of genetic cultural ties versus environmental influence of similar climatic, economic and social conditions are discussed. The latter, admitted important, is exemplified in the apparent similarity between the old-Eskimo culture of the Bering Strait area and the unrelated Buret' period several millennia older. Author favors a common origin of the Siberian late paleolithic population.

53734. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– , *and* V. V. NARYSHKIN. Neue Ergebnisse über alte Kulturen auf der Tschuktschen-Halbinsel. (Sowjetwissenschaft. Gesellschaftswissenschaftliche Beiträge, 1956, Heft 2, p. 244–51.) 3 refs. Text in German. ***Title tr.:*** New data on ancient cultures of the Chukotsk Peninsula.

German translation by H. Wüstemann of No. 41689. ***Copy seen:*** DLC.

53735. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Novye arkheologicheskie otkrytiîa v Vostochnoĭ Sibiri i drevnîaîa istoriîa Îakutii. (*In:* Akademiîa nauk SSSR. Îakutskiĭ filial. Doklady . . . 1954. p. 6–15.) 4 refs. Text in Russian. ***Title tr.:*** New archeological

discoveries in eastern Siberia and the ancient history of Yakutia.

Neolithic and early iron age finds along the upper and middle Lena River and on islands of the upper Angara are reviewed and linked to Trans-Baykal cultures. An iron age migration of cattle-herding tribes, forebears of present-day Yakuts, from the Lake Baykal area to the middle Lena region is suggested. ***Copy seen:*** DLC.

53736. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Novye neoliticheskie nakhodki na Angare, v raĭone der. Kezhmy. (Sovetskaîa arkheologiîa, 1952. t. 16, p. 320–26, illus.) 4 refs. Text in Russian. ***Title tr.:*** New neolithic finds on the Angara, in the Kezhma village area.

Describes several stone artifacts of the Serovo and Isakovo culture stages discovered in 1949 near the confluence of the Kezhma and Angara Rivers by members of the Geographical Research Institute of Moscow University. Of particular interest is a realistic sculpture of a fish (lake salmon) made of a marble-like stone. The carving and polishing techniques are discussed, and the perforations on abdomen and dorsal fin, indicating its use as fish lure, are noted. It belongs to the Serovo period, i.e., 4th millennium, B.C.

Copy seen: DLC.

53737. OKLADNIKOV ALEKSEĬ PAVLOVICH, 1908– , *and* I. A. NEKRASOV. Novye sledy kontinental'noĭ neoliticheskoĭ kul'tury na Chukotke; nakhodki u oz. Él'gytkhyn. (Sovetskaîa arkheologiîa, 1957, no. 2, p. 102–114, illus., maps.) 14 refs. Text in Russian. ***Title tr.:*** New traces of a continental neolithic culture on Chukotka; Lake El'gytkhyn finds.

Sketches the topography, hydrology, climate, flora and fauna of Lake El'gytkhyn (67°30′ N. 172°05′ E.) and surrounding Anadyr' plateau. The neolithic tools discovered on the lake shores by I. A. Nekrasov in 1955 are described. Especially noted are the chipped stone blades, more than 50, found in a cache or abandoned workshop; their intended use as dart, spear and javelin heads and knife blades is discussed. All implements in the cache were unbroken and made of hornstone flint, imported from the northern Anadyr' range on the arctic coast. The lack of ceramic or polished stone artifacts is ascribed to temporary use of the site by neolithic hunters in their annual trek following reindeer herds along the En'muveyem River from permanent winter quarters near Lake Chirovoye (approx. 66°25′ N. 173°25′ E.), where a settlement with semi-subterranean huts was excavated by N. A. Grave in 1952 (No. 31087). The economy, culture and artifacts of these pre-Eskimo inland nomadic hunters are compared with the pre- or Paleo-Eskimo population of the American North. Author considers these Chukotka reindeer hunters to be the original settlers of the New World. ***Copy seen:*** DLC.

53738. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . O pervonachal'nom zaselenii chelovekom doliny reki Leny; obshchiĭ obzor paleoliticheskikh pamîatnikov. (Akademiîa nauk SSSR. Institut istorii material'noĭ kul'tury. Kratkie soobshcheniîa, 1948. vyp. 23, p. 3–12.) 14 refs. Text in Russian. ***Title tr.:*** On man's first settling of the Lena River valley; a general survey of paleolithic monuments.

Describes the geological formations, artifacts and animal bones of 25 paleolithic sites discovered in 1941 and 1944 by the Lena historical-archeological expedition between Kachuga, on the river's upper course, and Markhachan (approx. 62° N. 123° E.). The implements (lunate scrapers, prismatic cores, lamellar blades, disks, etc.) are compared with those found in the paleolithic sites of Mal'ta and Buret' on the Angara River. The settlements, probably temporary hunting camps, are characterized by peculiar barrel-like hearths made of stone slabs. A drawing in red ocher of a wild stallion, realistic and almost life-size, discovered on the cliffs near Shishkino, in the vicinity of Verkholensk, points to the high artistic abilities of paleolithic man of the Lena basin. ***Copy seen:*** DLC.

53739. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Paleoliticheskaîa statuĕtka iz Bureti. (Akademiîa nauk SSSR. Institut istorii material'noĭ kul'tury. Materialy i issledovaniîa po arkheologii SSSR, 1941. no. 2, p. 104–108, illus.) 3 refs. Text in Russian. ***Title tr.:*** A paleolithic statuette from Buret'.

Describes a statuette made of mammoth tusk found during the 1936 excavations at Buret' on the Angara River. The 12.2 x 1.9 cm. figurine shows a woman dressed in a hooded fur garment closely resembling those worn by Eskimos, Chukchis and Koryaks. The fur is characterized by symmetrically incised grooves, and two tails (front and back), similar to the appendages on Eskimo

parkas, indicate a garment sewn from two hides. The presence of clad and unclad figures suggests that the climatic conditions of the late paleolithic era paralleled those of the present-day Arctic, resulting in an analogous practice of wearing fur clothes in the open and undressing indoors. ***Copy seen:*** DLC.

53740. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Paleoliticheskie zhilishcha v Bureti; po raskopkam 1936–1940 gg. (Akademiîa nauk SSSR. Institut istorii material'noĭ kul'tury. Kratkie soobshcheniîa, 1941. vyp. 10, p. 16–31, illus., diagr.) 19 refs. Text in Russian. ***Title tr.:*** Paleolithic dwellings in Buret'; excavations of 1936–1940.

Describes the systematic excavations of four late paleolithic house pits at Buret', on the Angara River. The great accumulation of large mammal bones and their position within the sites suggest their original use as house posts (mammoth long bones, rhinoceros skulls) and domed roofing (reindeer antlers). The similarity is noted between these huts (reconstructed in illus.) and the ancient, semi-subterranean, stone and bone reinforced winter houses of the Chukchis, Koryaks and Eskimos of Siberia, and the western and central Eskimos in North America (e.g., the "qarmanq", made of stone and whale ribs). A minute comparison is made with the one most akin, "val'kar" i.e., whale jaw house used to the 19th century by the Chukchis: shape, size and construction technique, subterranean tunnel leading to the river, etc. Though parallels to Chukchi and Eskimo cultures are also shown in other features of material culture (clothing, as revealed by clad female statuettes, artifacts, etc.), author refutes suggestion of a genetic link between proto-Eskimos and the paleolithic (Magdalenian) population of the Siberian interior. The similarity is explained as an environmental result of analogous geographic, economic and climatic factors, and the origin of the Eskimos traced to the neolithic peoples of the southeastern Pacific coast. ***Copy seen:*** DLC.

53741. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Pervaîa paleoliticheskaîa nakhodka v basseĭne Leny; Ponomarevskaîa stoîanka. (Akademiîa nauk SSSR. Institut istorii material'noĭ kul'tury. Kratkie soobshcheniîa, 1946. vyp. 12, p. 7–9, illus.) Text in Russian. ***Title tr.:*** The first paleolithic find in the Lena River basin; the Ponomarevo site.

Describes the large (predominantly flint) scrapers and cores and compares them with late paleolithic finds made on the Angara River. The general character of the Lena site suggests its use as a temporary camp unlike the permanent settlements at Mal'ta and Buret'.

Copy seen: DLC.

53742. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Primor'e v I tysîacheletii do nasheĭ ėry. (Sovetskaîa arkheologiîa, 1956. t. 26, p. 54–96, illus.) Refs. Text in Russian. ***Title tr.:*** The Maritime Province in the first millennium B.C.

Describes the inventory of neolithic so-called shell-mound settlements in the Okhotsk Sea area. Notes similarity between certain triangular slate harpoon points and biconical assymetrically bored points found here and in ancient Eskimo sites along the Bering Strait (p. 82); also the resemblance of dagger, spear and arrow points to those of Yakutia and other north Asiatic regions.

53743. OKLADNIKOV, ALEKSEĬ PAVLOVICH, 1908– . Raskopki na Severe. (*In:* Po sledam drevnikh kul'tur. v. 1, 1951, p. 11–46, illus. incl. color.) 8 refs. Text in Russian. ***Title tr.:*** Excavations in the north. Previously listed as No. 31091.

Reviews the history of the Russian discovery of northeastern Asia as well as the contradictory theories on the cultural potentials of northern peoples. Closest analogies to the paleolithic culture of Mal'ta and Buret' on the Angara River (dwellings, clothing, economy) are found in that of the Eskimos and Chukchis but inference that these two peoples are descendants of the Angara peoples is rejected. Cultural changes of the post-glacial (i.e., post-paleolithic) period are sketched, the subsequent neolithic stage of the nomadic hunters moving north along the Lena and other Siberian rivers toward the Arctic Ocean and east into Chukotka traced, and the paleolithic and neolithic artifacts described. Bronze and iron originating in the south (Scythians, Huns, Chinese) were carried north by forest and forest-tundra tribes. The Eskimo and proto-Eskimo cultures of the Bering Sea area (Asia and America) are discussed as an example for the high cultural levels attained by peoples of the

far North. The Mongoloid types found in 3rd millennium B.C. burials on Oleniy Island (Lake Onega, Karelia) together with stone artifacts closely resembling those discovered in 1942 at Lake Uolba (lower Lena basin) are related to a westward migration from eastern Asia. ***Copy seen:*** DLC.

Contains preliminary results of the examination of two right whales caught in 1956 with the object of clarifying the taxonomic status, using skeletons and various organs for comparison with other species and studying the nervous system, sense organs, larynx and heart. Details are given on color of the body (dark blue-black) and external parasitism (whale-louse), proportional measurements (table), baleen, food, weight of body parts, reproductive organs and skeleton. Fully illustrated. ***Copy seen:*** DLC.

53762. O'NEILL, J. B. The "Eliason" motor toboggan. (Polar record, Sept. 1958. v. 9, no. 60, p. 267–68, plate.)

Describes the toboggan found most useful by the Canadian Topographical Survey Division, Dept. of Mines and Technical Surveys, for trail-breaking and load-pulling in deep, soft snow along the tree limit. The single-track vehicle (2.3 m. long, 0.8 m. wide, and 1 m. high) is mounted on two skis and powered by a 9-hp., single-cylinder, air-cooled gas engine with magneto ignition; it has a maximum speed of 25 mph., a fuel consumption of 25 mi./gal., and a towing capacity of 1,000 lb., depending on snow conditions. The toboggan can be operated at 50° or more below freezing. Its advantages are lightness and trail-breaking ability; it can be used on floating ice. The drawbacks are: it lacks a driver's cabin, and the track and gears become iced up in slush.

53765. ONNERFELT, STIG E. Val av trädslag vid plantering i övre Norrland. (Skogen, *Stockholm,* Mar. 21, 1958. årg. 45, nr. 6, p. 171.) Text in Swedish. ***Title tr.:*** Selection of trees for planting in upper Norrland.

Spruce has been preferred to pine for high altitude and other hard regenerative areas in Norrland, as better adapted to fall planting and because the seedlings are more resistant to snow and the climate generally. Older spruce stands in the area, however, do not thrive. Frozen ground is deeper and lasts longer in spruce than in pine or mixed stands. Hence the vegetation period and viability of spruce are lower than in pine. Pine is more resistant to root injuries at planting, and to damage from reindeer trampling and melting snow, preconditions for tree-killing fungi. The viability of spruce in high altitude areas should be studied further.

53770. OPSAHL, WALDEMAR. Våre polare furuskoger. (Tidsskrift for skogbruk, Mar., Apr. 1934. årg. 42, nr. 3, 4, p. 67–71, 123–31, illus.) Text in Norwegian. ***Title tr.:*** Our polar pine forests.

The scattered growths of pine found in inland areas of Norway north of the Arctic Circle are remnants of continuous, fertile pine forests which covered the area more than 2,500 years ago, when the climate was milder and drier. With colder and damper climatic conditions, the forests receded from coastal and exposed areas, and the remaining forests have degenerated. Low regeneration is not chiefly due to scarcity of seed, which does ripen in warm summers, but to mice, reindeer, and, above all, degeneration of the soil. Work done during recent years for the preservation and regeneration of these valuable forests is described and recommendations are given for care of arctic pine forests. ***Copy seen:*** DA.

53771. ORDING, ASBJØRN. Klimaforandringer og de polare furuskoger. (Tidsskrift for skogbruk, June 1935. årg. 43, hefte 6, p. 171–77, maps.) Text in Norwegian. ***Title tr.:*** Climatic changes and polar pine forests.

Reviews the literature on the relation between climatic changes and pine forests in Finnmark and Troms provinces, with emphasis on J. G. Juel's *Furuens utbredelse i Finnmark og Troms*, pub. 1925 (copy not seen). Juel attributes the degeneration and recession of former fertile forests to the inability of seed to ripen in the present cold climate and to degeneration of the soil. From pollen studies in Troms marshland, Ording shows climatic change to be the main cause of local pine forest recession. The pollen diagrams, however, do not show whether the present pine forests are within the natural, climatic limits, or are relict from an earlier warmer and dryer period, with degeneration still going on. ***Copy seen:*** DA.

53772. ORLANDO, HENNING. Nya bostäder i Norrland. (Tidning för byggnadskonst, Dec. 1952. årg. 44, nr. 23, p. 927–29, illus.) Text in Swedish. ***Title tr.:*** New dwellings in Norrland.

Text in Russian. ***Title tr.:*** The intensity of frost pressure on seedlings and the influence therein of certain factors under conditions of the North.

In Arkhangel'sk Province, up to 50% of the pine and 80% of the spruce seedlings are winter-killed, being forced out of the ground by frost action. Factors involved in this phenomenon (weather conditions, soil, moisture, moss cover, etc.) were studied by the Arkhangel'sk Forestry Institute in 1955–57; the results are reported and discussed. Effective means for counteracting this process are not yet devised. ***Copy seen:*** DLC.

53775. ORLOV, FEDOR BORISOVICH. Osobennosti ukhodov za lesnymi kul'turami na Severe. (Lesnoe khoziaĭstvo, May 1957. god 10, no. 5, p. 23–26, tables.) Text in Russian. ***Title tr.:*** Special care in forest culture in the North.

Methods and technique used in care of the young forest since 1940 are discussed, with consideration of climatic and soil conditions and of top soil dynamics in relation to other factors in tree growth. The main concern in such forest care are cultivation, weed removal, loosening the soil for higher moisture absorption, etc., and frost protection of young sprouts. In each case, attention should be given to the biological and ecological properties of the species, to local climatic and soil characteristics, to age, etc. The softening of the ground must be stopped at mid-August to avoid early frost damage to the sprouts. Forest care operations are carried out manually; the application of machine methods is not widely developed as yet.

53779. ORLOVA, V. V. Granit͡sy boreal'nykh klimatov ravninnoĭ chasti SSSR; pod red. E. S. Rubinshteĭn. (Leningrad. Glavnai͡a geofizicheskai͡a observatoriĭa. Trudy, 1938. vyp. 19, p. 1–184, diagrs., maps (3 fold.), tables.) 98 refs. Text in Russian. Summary in English. ***Title tr.:*** The boundaries of boreal climates in the plains region of the U.S.S.R.; E. S. Rubinshteĭn, editor.

Monographic study on climatic zones. A critical survey is given of methods and systems of climatic zoning, from ancient times to present-day theories of A. Supan, W. Köppen, E. Ravenstein, T. Bergeron, L. S. Berg, A. Kaminskiĭ, and others. Meteorological conditions, chiefly air circulation, at the border of the taiga zone (termed zone of "boreal climate") are analyzed for three areas: (1) between the Yenisey and Lena basins, where the taiga zone divides into humid western and dry eastern parts, with typical conditions around Dudinka and Turukhansk on one side and around Yakutsk and Bulun on the other (p. 75–120); (2) the northern taiga border region next to the tundra zone, characterized by conditions at several arctic and subarctic meteorological stations, mainly in European U.S.S.R.: Kola, Mezen', Malyye Karmakuly, etc. (p. 120–69); (3) the southern and western border of the taiga zone (p. 169–77). Consideration of air circulation helps considerably in understanding and establishing the boundaries of climatic zones.

53780. ORMA, E. J. The effects of cooling the feet and closing the eyes on standing equilibrium; different patterns of standing equilibrium in young adult men and women. (Acta phsyiologica scandinavica, 1957. v. 38, fasc. 3–4, p. 288–97, tables.) 20 refs.

Women standing with their soles in ice water and eyes closed were found to sway significantly wider than men in similar conditions. The difference is attributed to differing muscle strength between the sexes. ***Copy seen:*** DNLM.

53781. O'ROURKE, CALVIN O. Electronic trail-finding. (Control engineering, May, 1957. v. 4, no. 5, p. 117+, illus. diagrs.)

A system of navigating Weasels along trails in the Arctic during poor visibility, is described. The trail consists of two wires forming a loop, buried 75 ft. apart in snow, and connected to a 60 cps. transformer system at one of the terminals. The Weasel is equipped with an antenna assembly, formed as a spherical configuration, an electronic receiver, a control panel, and a power supply. Energy induced in the antenna at various angles by the trail wires, is fed to a phase detector, which converts the signals to dc current and feeds it to a panel meter. The relative phase between the vertical and horizontal signal defines the meter's dc polarity and presents (visually) the vehicle's position on the trail. A buzzer and a warning light, included in the circuit, warn the driver if the vehicle goes off the trail or if the current in the trail wires is disconnected.

Handbook for travelers, with a brief sketch of railroad and river routes northward from Petersburg and Moscow, a general outline of Arkhangel'sk Province then including Kola Peninsula (p. 16–27). Descriptions follow of various places: Arkhangel'sk city and side trips to Kholmogory and the western ("summer") shore of Dvinskaya Bay (p. 27–52); to Solvetskiy Monastery, along Onezhskaya Bay to Onega, Suma, Soroka, Solovetsk and Kem', also along Kandalaksha Bay to the Monastery, Kem', Keret', Kovda, Kandalaksha, Umba and Kuzomen' (p. 68–81); in Kem' District "by the Karelians," from Kandalaksha across the Peninsula to Kola "by the Lapps" and along the Murman coast to Norway (p. 81–110); in Varangerfiorden (p. 110–115); to Belush'ya Bay, Malyye Karmakuly and Matochkin Shar on Novaya Zemlya (p. 115–20); along the north coast to the Pechora and Yugorskiy Shar Strait (p. 120–27). Each route is described with local maps and information on travel facilities, general character of the area, its physical features, settlements, population, economic conditions, history and references to basic literature. Appended are: list of 188 small lakes on Solovetskiye Islands (cf. map 1:168,000, at p. 52–53); glossary of local terms, and index of names. ***Copy seen:*** DLC.

53805. O'SULLIVAN, J. B., *and others.* Geology and bituminous stabilization of soil materials at Point Barrow, Alaska. Ames, Iowa, June 30, 1958. 96 p. 13 illus., 3 maps incl. 2 fold., 18 diagrs., 16 tables. (Iowa. State College. Engineering Experiment Station. Final report III, Project 320–S. Contract NONR–530(04).) 56 refs. *Other authors:* D. T. Davidson, K. M. Hussey, R. L. Handy *and* C. J. Roy.

Field studies of soil materials in Alaska were begun in 1954, to determine areal extent, geologic and engineering properties, and the trafficability characteristics of soils in the Matanuska, Big Delta, Fairbanks, and Point Barrow areas. Deficiencies of mechanical stabilization, and need for a satisfactory waterproof surface course, indicated a study of bituminous stabilization, using an available Alaskan crude oil as waterproofing and binding agent. Climatic factors, geology, and geomorphology of the Point Barrow area are described; the study of the crude oil and asphaltic residue is outlined; tests, and recommended pavement design are discussed. Conclusions (among others): bituminous stabilization of base and surface courses can be effected by available crude oil only after blowing; the beach is the most favorable location for roads and runways; construction on the tundra proper should be avoided. ***Copy seen:*** DGS.

53806. O'SULLIVAN, J. B., *and* **K. M. HUSSEY.** Problems associated with soils stabilization in the vicinity of Point Barrow, Alaska. (Iowa Academy of Science. Proceedings, 1957. v. 64, p. 429–42, illus., profiles, maps.) 5 refs.

Presents a part of results of research carried on by Dept. of Geology and Iowa Engineering Experiment Station, both of Iowa State College. Three parties visited Barrow in 1954 and 1955 with participation of engineers: Dr. D. T. Davidson, R. L. Handy, J. O'Sullivan, and geologists: C. J. Roy, Dr. K. Hussey. Location, settlements, climatic factors, and nature of soils are described; the need for soil stabilization is discussed. Silt, gravel, and sand, clay, ancient beach ridge coarse gravel, and natural asphaltic crude oil are available; their composition, quantity and quality, suitability and accessibility are noted. Mechanical stabilization is stressed as the most practical approach. Bituminous stabilization using asphaltic crude oil is a possibility. The most applicable solution may be combination of these two. ***Copy seen:*** DGS.

Account of measurements of the arterial-alveolar CO_2-gradient and pulmonary diffusing capacity in normal and hypothermic dogs. At low body temperature, diffusing capacity was reduced, but still adequate for transfer of both CO_2 and O_2, because the metabolic requirements for gas exchange are also reduced. ***Copy seen:*** DLC.

53812. OTTOSEN, PETER H. The *Vitiaz* in the Okhotsk Sea. (Navigation, Spring 1957. v. 5, no. 5, p. 224–30, diagrs., chart, maps.) 3 refs.

Oceanographic data obtained by Admiral Makarov on his voyage of 1886 (cf. No. 10760) are summarized and discussed. Oceanographic stations maintained by the vessel in this area are mapped. The temperature-depth and density-depth structures of the cold current passing east of Kamchatka are illustrated together with similar relationships with the Okhotsk Sea. A modern temperature-salinity plot is given for several stations in the Sea. A similar plot of stations maintained in Tatary Strait is given to illustrate the flow of Amur River water. ***Copy seen:*** DLC.

53813. ÔURA, HIROBUMI, *and* **S. KINOSITA.** On the measurements of the bending and compressive strengths of the frozen soil, the sea ice and the pond ice. (Teion kagaku, 1956. ser. A, no. 15, p. 137–47, illus., tables.) 12 refs. Text in Japanese. Summary in English.

Tests on beams and cubes of frozen soil with horizontal ice layers at 0° to −2° C., and sea and pond ice at 0° C. are described. Bending and compressive strength of standard samples of the three substances are determined and discussed. Larger samples exhibited the same bending strength as the smaller ones, while their compressive strength was three times that of the small samples.

53814. ÔURA, HIROBUMI. A study on the settling force of snow by models of photoelastic material; the lines of principal stress in the snow around the horizontal beam. (Teion kagaku, 1956. ser. A, v. 15, p. 185–91, illus.) Text in Japanese. Summary in English.

Account of experiments with gelatin

aimed to determine by analogy the elastic stresses developing in snow settling on a horizontal beam. The stresses developed in the gelatin were observed between two polaroid plates and photographed hourly. Photographs of the isoclinic lines are presented and lines of principal stress are reproduced.

53815. OUTHWAITE, LEONARD, 1892– . The Atlantic: a history of an ocean. New York, Coward-McCann, 1957. 479 p. illus., maps.

Combines oceanography, geography, and history in describing the structure, behavior, influence, and significance of the Atlantic Ocean. Located in the center of the earth's land mass, the Atlantic proper is extended by three large mediterranean seas, one of them the arctic. Winds and currents are described, and their effects traced on voyages and discoveries. On an assumption that the course of explorations over the North Atlantic sea routes has been neglected, the author deals in some detail with the early Viking voyages and colonizations, and the French and English discoveries in northeastern Canada; experiences of arctic whalers at a later date are also recounted. The Atlantic's importance as a food source and transportation route is considered, as well as its wartime strategic significance. The nation or nations controlling the Atlantic will control the heart of the world. ***Copy seen:*** DGS.

53816. OVCHINNIKOV, NIKOLAĬ MIKHAĬLOVICH, 1906–1958. Ėkspeditsii uchenykh. (Okhota i okhotnich'e khozi͡aĭstvo, Feb. 1958. god 4, no. 2, p. 30–31.) Text in Russian. ***Title tr.:*** Scientists' expeditions.

General survey of work done in 1957 by 16 parties sent out by the All-Union Scientific Research Institute of Animal Raw Materials and Peltry (Vsesoi͡uznyĭ nauchno-issledovatel'skiĭ institut zhivotnogo syr'i͡a i pushniny), of which the author was head. Scientific workers (76) of the Institute and (nearly 200) of other organizations participated in these expeditions; the natural conditions of 27 provinces of the R.S.F.S.R. and several Soviet Republics were studied. Prospects are said to be good in many areas for a considerable rise in returns of the hunting industry, including the Evenki and Yamal National Districts.

Describes Danish Navy's supply flights with Catalina-type amphibians to Jørgen Brønlunds Fjord (82° 10′ N. 31° 20′ W.). Intermediate base was established at Zackenberg (74° 29′ N. 20°48′ W.); ice observations were carried out for two Danish ships enroute to the same destination. ***Copy seen:*** DLC.

OVEY, CAMERON D., *see* Wiseman, J. D. H., *and* C. D. Ovey. Proposed names of features . . . deep-sea floor. *1955.* No. 56088.

53821. OWREN, LEIF, *and* **C. G. LITTLE.** Arctic radio wave propagation; task A, analysis of C–W data; final report. Fort Monmouth, N.J., Mar. 1958. 101 p. tables, graphs. (Alaska. University. Geophysical Institute.)

Relation between polar black-outs and signal outages on short high frequency paths of "Experiment Aurora" are analyzed for a year of high solar activity (1949–50) and compared with an analysis for a year of low solar activity (1954). In both years there were pronounced peaks in the signal outage time during the equinoctial periods. Comparative study of received signal strength over the long transmission paths and usable frequencies for these paths for the period 1949–55 showed no correlation. The combined effect of ionospheric irregularities and absorption on the transmissions over the 4 mc./s. short paths is investigated in detail for the year 1954–55, showing a reversal of the relative strength of mid-day signals recorded over the south-north and east-west paths during the spring equinox of 1955 compared with the winter 1954–55 and summer 1955. Results are explained by taking into account the effect of irregularities in the reflecting layer. Two models of the reflecting layer are studied, one represented by a surface having a one-dimensional corrugation parallel to the east-west direction, the other consisting of a reflecting screen with a grating of parallel circular cylinders in front. An analysis of the monthly median midnight and noon f_0F2 and h'F2 values at College for a 15½-year period is graphed; the monthly median values of the hourly received signal strength in log microvolts are tabulated for June 1949–Dec. 1950 and Jan. 1954–Oct. 1955. ***Copy seen:*** DGS.

53822. OXAAS, ARTHUR, 1888– . Svalbard var min verden. Oslo, Aschehoug, 1955. 224 p. illus. plates, map. Text in Norwegian. ***Title tr.:*** Svalbard was my world.

Autobiography of a hunter who first went to Vestspitsbergen in 1902, and spent 30 years there with an interval during World War II, also a winter on Bjørnøya, another on Jan Mayen. Working first on a share basis, sometimes alone, often as group leader, he accounted for over 1,800 blue and white foxes and 300 polar bears. He recounts events of his local trips, describes the regions traversed, weather, ice, living, and hunting conditions, cases of scurvy, etc. Important flights are noted. The scorched earth treatment of Vestspitsbergen in World War II is described. There is also discussion of coal mining, the Russian colony, attempts at quarrying marble, other test mining, and collecting of geological specimens on commission. ***Copy seen:*** DLC.

53824. PACHYNSKI, ALVIN L. The Air Force views over the horizon techniques. (Signal, Apr. 1958. v. 12, no. 8, p. 28–30, illus.)

Describes forward propagation ionospheric scatter systems established by the U.S. Air Force from Massachusetts and Loring Air Force Base to Goose Bay in Labrador, Thule and Søndre Strømfjord in Greenland; also in Alaska (White Alice) and in the DEW Line chain. Problems in reliability and performance experienced during initial operation of these multiplex voice and teletype installations are reviewed and their solution described. A system of long range tropospheric propagation is to be installed over an unidentified 690-mi. path in the Arctic, using 20-kw. single-sideband transmitters in the 350–450 mc. range, 120-ft. antennas and quadruple diversity. Two of the 24 voice-frequency channels will be multiplexed to provide 24 teletype channels. ***Copy seen:*** DLC.

53825. *PACIFIC BUILDER AND ENGINEER.* Bulk cement for isolated Alaska airstrip. (Pacific builder and engineer, Oct. 1958. v. 64, no. 10, p. 86–87, 146, illus.)

Describes hauling operation from

Seattle, Wash., and Sitka, southeast Alaska, to Bethel. Construction materials (200 tons) and 10,000 bbl. of bulk cement, housed in large steel containers welded to the deck were moved by barges. The contractor, Morrison-Knudsen Co., is to use the cement for expanding the Bethel airfield with a 4,000 ft. runway, a taxiway, and a parking apron, then utilize the airstrip in airlifting the construction materials to two unidentified construction projects in northern Alaska.

53826. ***PACIFIC BUILDER AND ENGINEER.*** Drills on platforms sample bottom for Anchorage pier. (Pacific builder and engineer, Mar. 1958. v. 64, no. 3, p. 92–93+, illus.)

Holes were drilled and 300 samples taken Oct.–Dec. 1957, over a 900 x 350 ft. area of the harbor, using equipment mounted on 20 x 20 ft. platforms atop two movable towers, 50 and 30 ft. high. The towers were moved by barge at high tide; equipment and the upper ten ft. of the 50-ft. tower were removed, the tower was lifted four ft. off bottom by the barge crane and tied to the bow of the barge, which then winched itself along by hoists and anchors to the next location. The sampling indicated a relatively firm bottom; bids for the first section of the pier are to be called in Mar. 1958.

53827. ***PACIFIC BUILDER AND ENGINEER.*** [News notes.] (Pacific builder and engineer, 1957–1958, v. 63–64.)

Includes several brief accounts of construction activities in Alaska not otherwise listed in this Bibliography, viz:

Highway program of $21½ million approved for 1957–58 (Apr. 1957, p. 17).

Summary of road constructions, reconstructions, improvements, and surveys scheduled for 1957 by the Bureau of Public Roads (Apr. 1957, p. 95).

Plans for a 1,100,000-kw. hydro project on Copper River; other hydro projects scheduled (Aug. 1957, p. 81).

Protection by metal collars on pilings to be tried on a project at Bethel (Dec. 1957, p. 86).

Reconstruction and realignment of Sterling Highway from Anchor River to Homer, and Ninilchik to Anchor River (Dec. 1957, p. 86).

Blue Lake $4 million hydroelectric and water supply project on the Medvetcha River to have two 3,000-kw. generators (Feb. 1958, p. 17).

Naval contracts for 1958 estimated at $3 million (Feb. 1958, p. 17).

Defense construction in remote areas to total $20 million in 1958 (Feb. 1958, p. 17).

Nuclear power plant to be built at Fort Greely (Feb. 1958, p. 17).

$4,102,000 aviation facility program scheduled for 1958–59 (Mar. 1958, p. 112, 114).

Projects of the Alaska Public Works Dept.'s 1958 program (Apr. 1958, p. 104).

List of 50 projects in the 1958 highway program (Apr. 1958, p. 104).

Construction of Kodiak small boat harbor ahead of schedule (May 1958, p. 132).

Blue Lake (Sitka) project underway (July 1958, p. 102).

Work started on nuclear power plant at Fort Greely, (July 1958, p. 102).

Statistics of construction budgets (1950–58) and predictions for future development (Aug. 1958, p. 76–77).

Missile detection base to be constructed at Clear, 320 mi. north of Anchorage (Sept. 1958, p. 9).

Construction on a nuclear reactor of 10,000 kw. at the Knik Arm power plant, near Anchorage, to start in 1961 (Dec. 1958, p. 12).

Road budget to exceed $7 million in 1959 (Dec. 1958, p. 12).

53832. PAINE, ROBERT. Changes in the ecological and economic bases in a Coast Lappish district. (Southwestern journal of anthropology, Summer 1958. v. 14, no. 2, p. 168–88, map, table, graph.) 19 refs.

A study of the economy, movements and activities of the Coastal Lapps based on materials collected in Revsbotn Fjord, west Finnmark. Their past fishing and whaling, reindeer hunting and herding, and present fishing and farming economies are described. Their changed economy, also the discovery of peat and coal, has affected their mode of life, and these influences are discussed. Their contacts with the Mountain Lapps, whose summer reindeer pastures they occupied, and their trade relations with Russia (to 1917) and Norway are dealt with. The Lapps' cultural and economic progress since the initiation of the North Norway Plan in 1945 is noted. The relation of fuel supply (wood, peat, coal) to movement, activity and type of settlement is tabulated and the annual climatic and economic data graphed.

Copy seen: DLC.

53833. PAINE, ROBERT. Coast Lapp Society I; a study of neighbourhood in Revsbotn Fjord. Tromsø, 1957. xvii, 341 p. illus., graphs, diagrs, tables, sketch maps incl. fold. (Tromsø. Museum. Skrifter, v. 4.) 157 refs.

Study of a typical small-group Coast Lapp unit, based on author's investigations during sojourns, 1951 and 1952, in Revsbotn, also among a neighboring Mountain Lapp group in 1953. Ecological situations and cultural relations are dealt with (p. 3–161): the general geography, topography and history of the locality (approx. 70°35′ N. 24°36′ E.) on the North Norwegian coast are described; trade relations and cultural contacts with Norwegians and Russians, influence of missions, settlement of the fiordal region, etc., are discussed. Present-day changes in the economy: peat and coal mining, fishery, agriculture, and cultural relations with other Lapps and non-Lapps are described. In the second part of this volume (p. 161–317) the social structure, kinship system and affinity, name system, marriage customs, neighbor relations, settlement problems, etc., are discussed. The gradual evolution of a new Coast Lapp sociological pattern is outlined: a fiordal village society emerges, taking the place of individual homestead units and creating administrative changes, etc. Account of Coast Lapp markets, translated and summarized from J. Falkenberg's 1941 paper, a list of Lappish terms, and a subject index are appended. A second volume is planned to deal with the family and its role among the people of Revsbotn Fjord. ***Copy seen:*** DGS.

53834. PAINE, ROBERT. A meeting with Laestadians. (Norseman, Mar.–Apr. 1957. v. 15, no. 2, p. 112–17.)

Laestadianism has replaced shamanism as a means of expressing the "Lappish spiritual essence"; a sectarian meeting in northern Norway is described.

Copy seen: DLC.

53835. PAINE, ROBERT. The Russian trade in Finnmark. (Norseman, Mar.–Apr. 1958. v. 16, no. 2, p. 73–80.) 7 refs.

Recounts trading of grain for fish along the Finnmark-Troms coast, 1796–1917, by Russian peasants from the Kola Peninsula. This trade, previously carried on illegally, was declared lawful by the Royal Resolution of Aug. 5, 1796. It was a significant factor in the culture and economy of the area: frequently prevented famine, influenced the pattern of settlement along the coast, tied the people more closely to the sea, encouraged pastoralism as a secondary economy, and gave rise to numerous sagas and legends of "the Russian times". The economic and political background of the coastal area where the trading occurred is discussed. ***Copy seen:*** DLC.

The scientific career and contributions of Enzio Reuter, 1867–1951, are reviewed. He was state entomologist, and professor of zoology. His early study of butterflies was succeeded by that of destructive insects, their life cycles, broader aspects of life processes, etc., and latterly by study of chromosome division and cytology. His major works are briefly summarized and the range of his publications stressed. ***Copy seen:*** DGS.

53845. PALONIEMI, MIKKO. Rovaniemen Kolpeneen meripihkakoru. (Suomen muinaismuistoyhdistys. Suomen museo, 1955. v. 62, p. 107–109, illus.) 3 refs. Text in Finnish. Summary in German. ***Title tr.:*** An amber ornament from Kolpene at Rovaniemi.

Describes a spatula-shaped pendant found during the 1955 excavations of the stone site at Kolpene, Rovaniemi district (No. 50767). Of East-Prussian origin, like all Finnish amber finds, the pendant is dated by the site's comb ceramic into the time of the so-called Äyräpää II,1 style and is, therefore, the oldest amber ornament discovered as yet in Finland. ***Copy seen:*** DLC.

53846. PALOSUO, ERKKI. Methods used in the ice service in the Baltic. (*In:* Arctic Sea Ice Conference. Proceedings, 1958. p. 239–43, text map, diagr.) 11 refs.

Reviews and evaluates methods used to predict exact time of initial freezing, based on energy exchange considerations; and to predict growth and decrease in size of ice area, by statistical means. Duties of the ice prediction service of Finland are outlined; its importance to shipping is stressed. ***Copy seen:*** DN–HO.

53847. PALOSUO, ERKKI. Über verschiedene Vereisungstypen im Finnischen Meerbusen. (Deutsche hydrographische Zeitschrift, 1956. Jahrg. 9, Heft 5, p. 222–25, diagr., maps, table.) Text in German. Summary in English and French. ***Title tr.:*** On different types of ice formation in the Gulf of Finland.

Static and dynamic ice formation in this area are described: the former occurs in the absence of wind or during light northeast winds; the latter in the presence of strong winds, when ice builds along the coast and drifts out to sea in a continuous sequence until the entire Gulf is frozen. Lower temperatures are required for dynamic ice formation than for static to cover the entire surface. A map indicates the progress of drift ice in Feb. 1953. Freezing temperature sums and type of ice formation 1947–56,

also the relation between ice formation, wind, and temperatures at various locations in the Gulf are tabulated and graphed. ***Copy seen:*** DLC.

53852. PANKOV, V. A., *and others.* Chuma pest͡sov. (Karakulevodstvo i zverovodstvo, Nov.–Dec. 1957. god 10, no. 6, p. 59–60.) Text in Russian. *Other authors:* S. I͡A. Li͡ubashenko *and* V. N. Mezht͡siems. ***Title tr.:*** Polar-fox pest.

Description of an epizootic, affecting young and adult animals, during 1955 and 1956. Symptoms, losses (10%), pathological anatomy, bacteriology, etc. are dealt with. ***Copy seen:*** DLC.

53853. PANOFSKY, HANS ARNOLD ALBERT, 1917– , *and others.* A study and evaluation of relations between tropospheric and stratospheric flow. University Park, Pa. Aug. 1, 1958. 91 p. 15 tables, 32 graphs, 9 text maps. (Pennsylvania State University. Mineral Industries Experiment Station, Dept. of Meterorology. Prepared for the Naval Weather Research Facility under Contract no. N189(188) 34785A. Final report.) 6 refs. *Other authors:* L. Krawitz, *and* P. R. Julian.

Results of a project to study the relationship between tropospheric flow, particularly at 500 mb. and stratospheric flow below 50 mb. to: (1) devise a method to specify 100 mb flow, given 500 mb. charts; (2) obtain some understanding of the relationships between tropospheric and stratospheric flow. The winters of 1953–54 through 1956–57, and the summers 1955 through 1957 were studied with data from 11 stations, including seven in arctic Canada, and two in Alaska. Properties of the Polar Regime Boundary (approximately the boundary between polar and middle-latitude circulation) and the Polar Vortex are described; the effect of the position of the Polar Vortex on the stratospheric westerlies of North America is outlined; a relation is suggested between observed

(tropospheric) and calculated (stratospheric) wind speeds and directions.

53858. PANTENBURG, VITALIS, 1901– . Eine Stadt wird verlegt: Aklavik, Kanadas erste moderne Stadt in der Arktis. (Kosmos, Dec. 1957. Jahrg. 53, Heft 12, p. 569–75, 9 illus., map.) Text in German. ***Title tr.:*** A town is relocated: Aklavik, Canada's first modern town in the Arctic.

Outlines development of the settlement around a Hudson's Bay Co. trading post, established in 1912 at 68°13′ N. 135°01′ W. During 1919–1926, churches, Royal Canadian Mounted Police post, and a radio station were introduced, but ground conditions ("a muddy sandbank") restricted construction and lack of year-round aircraft landing facilities in post-war years, made impossible any development of Aklavik into an administrative and communications center for northwest Canada. Another site, on more stable ground, was found for this town of 700 inhabitants, on the east bank of an eastern arm of the Mackenzie delta, 56.5 km. from the old location. On the new site, named Inuvik, at 68°21′ N. 133°42′ W., the buildings are erected on 6–9 m. piles, frozen 5–8 m. into the ground. Water supply and electric power lines are laid in a utilidor, a well-insulated main on piles well above the ground. The installations are kept frost-free by a hot-water pipe in the same main. Work at the new location started in 1955, foundation construction in 1956. The new town planned for 2,500–3,000 inhabitants, is to be completed by 1961. Illus. include photo of buildings being moved by tractor sleds from old to new site. ***Copy seen:*** DLC.

53859. PANTENBURG, VITALIS, 1901– . Svalbard, Inselland vor dem Pol. (Orion, Aug. 1957. Jahrg. 12, no. 8, p. 645–52, illus. map.) Text in German. ***Title tr.:*** Svalbard, islands before the Pole.

Presents photographs with brief account of the archipelago, midway between Nordkap and the North Pole: physiography, geology, exploration, climate, flora and fauna. Barendsz's discovery of the islands and its effect on whaling; recent history and Norway's sovereignty;

511326—60——56

the coal deposits and their exploitation, shipping connections, other mineral resources are noted; also Russian interests in Svalbard coal as compared with those of Norway, and the rights of other nations.

53863. PARKER, ROBERT R., *and* **W. KIRKNESS.** King salmon and the ocean troll fishery of southeastern Alaska. Juneau, Sept. 1956. 64 p. illus., tables, maps. (Alaska. Dept. of Fisheries. Research report no. 1.) 28 refs.

A study of yields since 1900, of racial composition, stock characteristics, and regulations in this fishery. Production reached a peak in 1937 with 17 million lb. of dressed fish, but subsequently declined to 9 million lb. due to destruction of spawning and rearing areas, principally by dams built on the Columbia River. Three stocks of fish were found in the outside waters, the characteristics of which are given. The potential effects of fishing regulations upon these stocks are analyzed and discussed.

53864. PARKES, ALAN STERLING, 1900– . Viability of ovarian tissue after freezing. (Royal Society of London. Proceedings, 1957. ser. B, v. 147, no. 929, p. 520–28, illus., tables.) 23 refs.

A study in survival of cumulus cells of the follicular granulosa, as determined by tissue culture. A majority of these cells survived when cooled slowly in homologous serum to −79° C. and thawed rapidly at +40° C.; very few survived rapid freezing. Addition of glycerol improved survival from slow, but not from rapid freezing. Cells suspended in saline did not survive any of the two freezing methods and addition of glycerol promoted survival after slow cooling only.

53867. PARMUZIN, ﬁU. P. Ėkzoticheskaiâ gal'ka Srednei Sibiri. (Moskva. Universitet. Uchenye zapiski, 1956, vyp. 182, Geomorfologiiâ, p. 187–91. map.) Text in Russian. ***Title tr.:*** Exotic pebble in Central Siberia.

Since the mid-19th century, explorers have drawn attention to pebbles and boulders in various areas of Central Siberia which do not belong to the local geological formations and had evidently been transported from distant mountain regions (Stanovoy, Sayanskiy, Anabarskiy, and other ranges). Deposits of such "exotic" pebbles are reported from the Taymyra, Pyasina, Yenisey, Kotuy, Lena, Vilyuy, Olenek, Angara, Katanga (=Podkamennaya Tunguska) and Nizhnyaya Tunguska basins; they are found not only in valleys, but on watersheds as well, and study of them is important for any reconstruction of paleogeographic features and the ancient (Tertiary) river system.

53868. PARMUZIN, ﬁU. P. O zonal'noi prirode polûsa kholoda. (Vsesoûznoe geograficheskoe obshchestvo. Izvestiiâ, Sept.–Oct. 1958. t. 90, vyp. 5, p. 472–74, map.) Text in Russian. ***Title tr.:*** The zonal nature of the cold pole.

Outlines the character of the cold pole and reasons for its relocation in northeast Siberia. For a net of meteorological stations in the area 63°31′–68°30′ N. 93°31′–160°30′ E., three zones of absolute minimum temperature (−67° to −71° C., −65° to −66° C., and from −60° to −64° C.) are mapped; the lines of lowest temperature for the Northern Hemisphere, and coldest anticyclonic winds are drawn. The zone is thus shown to be more relevant geographically and climatologically for the cold pole than a point. Hence the forty-year concept of Verkhoyansk as the cold pole because it registered an absolute minimum of −67.6° C. in 1892, should be changed. Extreme continentality, cold winter anticyclones, and relief produce the conditions for such a zonal cold pole.

Reviews "slow accumulation of knowledge by observation through the centuries, . . . its culmination in the great work of Carl Størmer," and surveys current developments. Ionospheric relations are complex, and little progress has been made in the correlation of radio echo and visual observations. Solar relations are more clearly understood. Theoretically, it is possible to determine temperatures of the upper atmosphere at auroral levels from spectral characteristics; but a satisfactory theory of the cause of aurora has not been derived. Numerous observations have been made and analyzed.

53883. PATTON, W. J. H. Mississippian succession in South Nahanni River area, Northwest Territories. (*In:* American Association of Petroleum Geologists. Jurassic and Carboniferous of Western Canada, 1958. p. 309–326, illus., maps.) 17 refs. Abstract previously listed: No. 47275.

From fossil evidence, rocks of Kinderhook, Osage, Meramec, and Chester age are known to be present in a thick section of Mississippian rocks exposed west of Jackfish River in the La Biche Range of the Mackenzie Mts. near the South

Nahanni River (61°06′ N. 123°59′ W.). Strata with a Kinderhook fauna equivalent in age to the Banff formation are lithologically similar to it, but equivalent Rundle strata with Osage, Meramec and Chester fossils consist of interbedded argillaceous limestone and calcareous shale overlain by a great thickness of sandstones with minor shale and coal beds. Fossil plants *Stigmaria* sp. and *Lepidodendron* sp. and coal were found in sandstones below the Meramecian *Spirifer* cf. *pellaensis* zone. Microspores indicate a Lower Carboniferous flora (cf. No. 40196). Spores in the coal are not like those found in Mississippian coal of Utah, but similar to those described from the Carboniferous of the Ukraine.

53884. PATTON, WILLIAM WALLACE, 1923– . A new Upper Paleozoic formation, central Brooks Range, Alaska. Washington, D.C., U.S. Govt. Print. Off., 1957. p. 40–45, 2 text maps. (U.S Geological Survey. Professional paper 303–B. Exploration of Naval Petroleum Reserve No. 4 and adjacent areas, northern Alaska, 1944–53. Part 3, Areal Geology.) 3 refs.

Identifies and describes the Siksikpuk formation, a new Upper Paleozoic (probably Permian) sequence of shale and siltstone; in mapped area from the Anaktuvuk River (approx. 68°30′ N. 151° W.) west to the Kiligwa on the Chandler L. quadrangle; a type section near Tiglukpuk Creek (approx. 68°17′ N. 151°50′ W.) is treated in detail. Disconformities separate the Siksikpuk from the Lisburne (Mississippian) below, and the Shublik (Triassic) above. The Siksikpuk is intensely faulted and folded; exposures are limited to small, scattered cutbanks along the streams. Age determination was chiefly made on the basis of coral fauna, occurring in the basal 50 ft. of the formation. ***Copy seen:*** DGS.

53885. PAULY, HANS. Igdlukunguaq nickeliferous pyrrhotite; texture and composition, a contribution to the genesis of the ore type. København, C. A. Reitzel, 1958. 167 p., 20 plates, illus., maps, diagr., sections. (Meddelelser om Grønland, bd. 157, nr. 3.) 58 refs.

Contains description of a pyrrhotite deposit on the northeast coast of Disko (approx. 70° N. 53° W.), the only such deposit found in Greenland. It is a block of about 28 metric tons, discovered by Steenstrup in 1872, in a dike rock of the basalt complex covering most of Disko and the nearby mainland. The ore has the composition of normal nickeliferous pyrrhotite, but presents a remarkable variety of phases and exsolution structures, ranging from chalcopentlandite, formed at near 850° C., to a form of pyrrhotite formed at near 140° C. A three-stage development is disclosed: initial, from which the primary oxides came as a result of gases originally held within the molten sulphide mass; main stage, where consolidation of the sulphides took place together with the solidification of oxidic material; third stage, dominated by hydrothermal processes. Microscopic study of the ore and chemical analyses of rocks and ore are discussed in detail; mineral and chemical content are summarized in tables. Evolution of the ore is traced; comparison is made with other nickel-bearing deposits. The relation of this ore to preceding geological phenomena is treated. Plates show 79 polished sections. ***Copy seen:*** DGS.

Izvestiîa, ser. geologicheskaîa, Sept. 1958. god 23, no. 9, p. 3–24, 7 text maps, diagr.) 18 refs. Text in Russian. ***Title tr.:*** The problems of the endogenous magnetite ore genesis in the Tungusska syncline of the Siberian platform.

The main literature on this question is reviewed. Basic features of the structure are outlined. The endogenous ore localities of the region (over a million sq. km. in area) and their development with respect to tectonic zones and various phases of trap volcanism are discussed. Development of magnetite ores is dependent on ore-containing solutions from basaltic magma which is determined by the stage of eruption and depth of the volcano. Magnetite ore occurrences in veins, dikes and other forms are outlined. Two magmatic phases are distinguished and their age considered. Besides the Angara-Ilim area, already known, other iron ore fields in the Podkamennaya Tunguska, Kureyka, Bakhta, etc. basins are reviewed, and their mineralic composition are summarized.

The Dolomitovaya Varaka granite intrusion (approx. 67°30′ N. 33°40′ E.) is 4 km. south of the Apatity railroad station and southeast of Lake Imandra. Its geologic characteristics are presented and petrographic properties outlined. Mineral composition of these subalkaline biotite granites is characterized by quartz, microcline-perthite, albite, biotite-lepidomelane and the accessory minerals: borax-orthite, apatite, titanite, magnetite, and xenotime (?). In these granites, results of widespread processes of alkaline and quartzitic autometasomatosis are observed and also the related albitisation of plagioclase and petrification of microcline. Occurrence of aegirite, arf-

vedsonite, natro-tremolite, nepheline, albite and phlogopite results from contact-metasomatic reaction.

53915. PEEBLES, P. J. E. Ionospheric absorption measurements on a frequency of 2 mc./s. at Baker Lake and Churchill. Ottawa, 1956. 8 p., 27 p. graphs. (Canada. Defence Research Telecommunications Radio Physics Laboratory. Project report, 3–6–3. PCC No. D48–95–11–02.)

An analysis of absorption data obtained during the period May 1955 to July 1956 is presented. Absorption data obtained in this auroral zone are graphed and analyzed. Mathematical expressions are evolved for the median daylight diurnal absorption and for night absorption. A close correlation was found between individual absorption periods and certain types of short-term magnetic disturbances. A correlation was also found between magnetic disturbance (K) and absorption disturbance (N) for large magnetic disturbances. The winter anomaly effect was greater on and inside the maximum auroral region than outside the region. ***Copy seen:*** DNRL.

53916. PÉGUY, CHARLES PIERRE, 1915– , *and* J. CORBEL. Chronique arctique. (Norois, July–Sept. 1957. année 4, no. 15, p. 395–409, map, diagrs., graphs.) 36 refs. Text in French. ***Title tr.:*** Arctic chronicle.

Reviews recent work and publications on: glacier and ice studies (by American, French and Russian scientists), the Soviet Arctic, and, briefly, French activities of 1956 in Labrador, Greenland and Lapland. Russian investigations in the Arctic Basin, on problems of continental physical geography (effects of snow cover on soil temperature and moisture preservation, permafrost, periglacial morphology, etc)., and on northern aboriginals are outlined. The seeming population growth of the industrial far North is ascribed to imported Russian labor. A project for developing the Northern Sea Route with atomic icebreakers is mentioned as superseding an earlier plan of a Lena River–Okhotsk Sea canal.

53918. PEHRSON, ROBERT NIEL, 1926–1955. The bilateral network of social relations in Könkämä Lapp District. Bloomington, Ind., 1957. 128 p. tables, diagrs. (International journal of American linguistics, Jan. 1957. v. 23, no. 1, pt. 2.) 73 refs. *Also issued as:* Indiana University, Research Center in Anthropology, Folklore and Linguistics, Publication 3.

Dissertation presented to University of Chicago, 1955, based on work in 1948–49 and 1951–52 with Swedish Mountain Lapps, reindeer herders, of this district in Karesuando Parish. Their social organization is dealt with as based on the paternal-maternal kinship pattern. The consanguineal relationship, genealogical structure and sociological ramifications are analyzed and kinship terminology tabulated. The bearing of bilateralism on inheritance and marriage customs, selection of leaders, working partners, herders, etc., are discussed. The characteristically Könkämä Lappish flexibility and variability in social organization as well as the absence of extensive corporate groups, except for the sibling group, is traced to bilateralism, a structural form apparently best suited to large-scale reindeer herding. The similarity to the bilateralism of the extensive reindeer-herding Chukchis and Koryaks is noted and opposed to the unilateralism of the Ostyaks and Tungus with their more limited reindeer economy. Favorably reviewed by D. B. Shimkin in *American anthropologist,* Aug. 1957, v. 59, no. 4, p. 734–36. ***Copy seen:*** DLC.

Über das Wegtragen von künstlichen, besonders von gefärbten Kotballen beim rotsternigen Blaukelchen, *Luscinia s. svecica.* (Suomalainen eläin- ja kasvitieteellinen seura Vanamo. Tiedonannot (Archivum), 1957. v. 12, no. 2, p. 146–55, illus., 3 tables.) 24 refs. Text in German. ***Title tr.:*** On the carrying away of artificial, in particular colored, dung-balls by the bluethroat *Luscinia s. svecica.*

Contains account of this warbler, as observed in the summers 1954–1957, near Kilpisjärvi (69°03′ N. 21°49′ E.) in southwest Lapland: its breeding biology, and the procedure used by both females and males to clean the nest of the chicks' droppings. Swallowed by the parent birds during the first three days, the excreta are later dropped 5–25 m. from the nest. Differently colored artificial pellets of wet cotton were used to determine the effect of color on this cleaning instinct. On females white had the strongest effect, then blue and black, yellow-orange and red; green was least effective. Results were different for the males: their preference was blue, then white, yellow, orange, red, and last, a black and green. At twilight choices were different, but irrespective of lighting, the real excreta were always removed first, then the cotton balls of color nearest that of the chick droppings. ***Copy seen:*** DLC.

(Materialy k poznaniiû geologicheskogo stroeniiâ SSSR. nov. ser., vyp. 4(8).) 155 refs. Text in Russian. Summary in English. ***Title tr.:*** The tectonics of the Northern Ural bauxite belt.

Presents the results of author's investigation with the Academy of Sciences' expedition in 1941–45, a two-fold study of the tectonic structure of bauxite fields lying between the Tura and Loz'va Rivers, and of the petrology and mineralogy of aluminous bauxites in the section between the Sos'va and Vagran Rivers, where they have been known since 1931 and are under development at Krasnaya Shapochka, Kal'mskoye, Cheremukhov-

skoye. The tectonic history and structural forms are outlined. Occurrences and types are discussed with special attention to Devonian bauxites widely distributed in the Northern Ural. Mineralogical and chemical properties are treated. The general theory of bauxite development is considered inapplicable to the Northern Ural. ***Copy seen:*** DGS.

53922. PEJLER, BIRGER. On variation and evolution in planktonic Rotatoria. (Uppsala. Universitet. Zoologiska bidrag från Uppsala, 1957. bd. 32, p. 1–66, 106 illus., 6 tables.) 97 refs.

Contains descriptions and analysis of the variation in rotifers occurring in lakes and small waterbodies in Swedish Lapland and Central Sweden (Uppland and Närke). Different types of variation are distinguished and exemplified, viz: (a) ecoclinal variation, (b) geographic variation in which no clines could be perceived, (c) discontinuous variation within a single water body, and (d) non-adaptive variation. The planktonic forms represent isolated terminations of branches of the ancestral rotatorian tree, and they play a subordinate role in the interpretation of the main phylogenetic lines within the group. The planktonic rotifers possess special adaptive structures for a pelagic life. ***Copy seen:*** DSI.

Text in Russian. ***Title tr.:*** Role of friction and cohesion in actual shear stress of frozen ground for cases of rapid load increase.

"The recent state of the problem is outlined, and the insufficiency of the data for theoretical conclusions is noted. Laboratory measurements of the shear strength of frozen ground and the effects of loading and compaction before freezing on its variations are discussed. Data on friction and cohesion of frozen clay under loading from 4–12 kg./sq. cm. are tabulated and compared with similar data for rock. Maximum effects of cohesion forces on the shear strength of frozen clay appeared under moderate loads and decreased as the load increased. Cohesion and friction were factors of primary importance in rating the discontinuous strength of frozen ground. The decrease in shear strength with increased temperature is related to the lowered cohesion and friction with rising temperatures."— SIPRE. ***Copy seen:*** DLC.

Text in Russian. Summary in English. ***Title tr.:*** The Aldan iron ore province, its districts and prospects.

Reports results of the southern Yakutia expeditions of the Ministry of Geology and of Mineral Resource Conservation in 1952–1957. The Aldan iron ore province located mainly in the Olekma-Aldan and Aldan-Timpton interfluves (58°–60° N. 120°–122° E.), is composed mainly of Archean metamorphic and intrusive rocks; and divided in four series. Each series is characterized in turn, its distribution and thickness outlined. Five genetic types of iron ore occurrences are distinguished: magnetite ore in a productive horizon of Archeozoic Fedorov series; magnetite ore of the Archeozoic Timpton-Uchur series; iron quartzite ore of Archeozoic and Proterozoic age; contact-metasomatic magnetite ore affected by post-Jurassic intrusions; hydrothermal hematite ore of Proterozoic age. Ore types and their areas are indicated. Of these, only Fedorov series in the Legliyer, Sivagli and Emel'dzhak areas is of economic importance. The average iron content is 40–46%. Ores in the Sivagli deposits have an increased sulphur content (to 3.5%) and 0.12% phosphorus; both impurities can be separated easily. The iron ore reserves are estimated at 1.6 billion tons; further discoveries are predicted.

Sojka. ***Title tr.:*** The influence of hypothermia on the behavior of the electrophoretic fractions from serum proteins of rabbit blood.

Account of experiments on rabbits made hypothermic with "lytic mixture." Lowering of total protein in the serum depended on the dose of the drugs and the degree of hypothermia, an increase of both resulting in a fall of the serum protein. Increased administration of drugs and hypothermia had "a beneficial influence on the stability of relations" between the fractions of the serum protein. ***Copy seen:*** DNLM.

53944. PESCHANSKIĬ, IVAN STEPANOVICH. O nekotorykh problemakh arkticheskogo ledovedeniîa. (Problemy Arktiki, sbornik stateĭ, 1957. vyp. 2, p. 161–70, graphs.) Text in Russian. ***Title tr.:*** Some problems of arctic ice science.

Results of studies on the physical and mechanical properties of ice and ice covers in the Arctic since 1946 are out-

lined and discussed to elucidate the basic problems of ice science. Freshwater and sea ice must be studied as materials distinct from ice cover as a geographical phenomenon. The physical and mechanical properties of ice can be studied comprehensively under laboratory conditions with due regard for the comparability of data obtained under field conditions; standardization of sample size and reduction factors is required. Studies of electromagnetic, thermal, and radiation properties continue.—From SIPRE. ***Copy seen:*** DLC.

53945. PESCHANSKIĬ, IVAN STEPANOVICH. Physical and mechanical properties of arctic ice and methods of research. (*In:* Arctic Sea Ice Conference. Proceedings, 1958. p. 100–104.) 7 refs.

The properties of sea ice are examined on the basis of recent studies in the U.S.S.R. The elastic limit of ice is not constant but depends on temperature. Strain velocity increases at high pressure velocities (approaches infinity), while at low pressure velocities it remains constant and there is plastic flow. Ice growth does occur under dynamic compression, and under static compression due to external forces acting on immobile ice. Complicated fluctuations of the ice cover were observed, "rest" cycles alternating with violent cycles of varying intensities ranging in frequency from 0.01 sec. to 1 min. Fluctuations resembling earthquakes were also noted. When fluctuations caused critical sagging, the ice cover broke up. The modulus of elasticity of the natural ice cover was determined by seismic measurements as 60,000 kg. per sq. cm. Seasonal strength characteristics are outlined.

53946. PESCHANSKIĬ, IVAN STEPANOVICH. Stikhiĭa l'da. Moskva, Izd-vo "Morskoĭ transport," 1957. 119 p. illus., table, graphs, diagr., map. Text in Russian. ***Title tr.:*** The element of ice.

Physical and mechanical properties of ice and various phenomena related to its formation, also the stresses, and crushing force developed in movement or expansion, and methods of combatting them are described in popular form. Freezing and thawing processes in general, and of glacier sea and river ice, are explained, with pertinent terminology. Origin of glaciers, icebergs, ice islands is discussed. The crushing process is associated with dynamic and static forces. Theories of ice drift are reviewed, with account of Sverdrup's theory of wind and current effects and Shulelkin's correction on Coriolis force and resistance of ice and water (p. 32); and with experience of various arctic expeditions, from that of Payer and Weyprecht in 1872–74 to drifting station North Pole-7, cited (p. 25–50). Altberg's hypothesis on anchor ice and sludge (shuga) formation is discussed in relation to the stream's super-cooled surface layer and water-mixing during turbulent motion. Transformation of super-cooled water into ice is considered as self-acting in contrast with V. V. Lavrov's concept and experiments indicating initiation of crystallization by external stimuli (p. 57–58). Methods for preventing sludge formation and eliminating its effects are outlined. Mechanical stresses of the ice cover as they affect cargo loading are analyzed with tabulated experimental data for different seas (p. 72) and graphical illus. of ice and strength in relation to load and load distribution (p. 77). Ice stresses are discussed as affected by moving or concentrated loads, salinity, and temperature of the ice, presence and direction of cracks, and character of ice formation (p. 79). Practical problems are considered, among them the use of ice in the depth-freezing method for removing rocks and restrictions from river bottoms, the dry-dock method, melting of the surface ice by ash dusting. ***Copy seen:*** DLC.

Three plays on modern and historical themes, one on the discovery of diamonds in Yakutia. ***Copy seen:*** DLC.

53950. PETELIN, VENIAMIN PETROVICH. Mineralogiîa peschano-alevritovykh frakt͡siĭ osadkov Okhotskogo morîa. (Akademiîa nauk SSSR. Institut okeanologii. Trudy, 1957. t. 22, p. 77–138, illus., tables, maps.) 83 refs. Text in Russian. ***Title tr.:*** The mineralogy of the aleuro-sandy fractions in the sediments of the Okhotsk Sea.

Account of investigation based on materials collected during 1949–52 by the *Vitiaz'*. Successive sections deal with the scope and methods of study; geological outline of the coastal areas; characteristic of the deposits; mineralogical composition of the aleuro-sandy fractions; distribution of minerals, of the heavy subfraction, etc. (with maps for the main mineral components); distribution of autogenous minerals; mineralogical regions of the Okhotsk Sea. ***Copy seen:*** DLC.

53951. PETELIN, VENIAMIN PETROVICH, *and* **È. A. OSTROUMOV.** O nekotorykh osobennostîakh raspredeleniîa zheleza v osadkakh Okhotskogo morîa. (Moskovskoe obshchestvo ispytateleĭ prirody. Bûlleten', nov. ser, 1958. t. 63, otd. geologicheskiĭ, t. 33, vyp. 2, p. 93–102, table, maps.) 31 refs. Text in Russian. ***Title tr.:*** Some features of the distribution of iron in the Sea of Okhotsk sediments.

Presents the results of investigation by expeditionary vessel *Vitiaz'* in 1949–50 on concentration and origin of iron in the bottom sediments. Average concentration is 5% and maximal 11%. Largest concentration is found in sandy sediments near the Kuril Islands and in some areas close to Kamchatka shores. Maps show variation of iron (in percentage) and types of sediments. The iron is brought mainly with river-transported materials and with products of active volcanoes. The Sea of Okhotsk, it is suggested, in view of its unusually high percentage of iron should be excluded from general classification of the world seas.

53953. PETERSEN, JOHAN CHRISTIAN AUGUST, 1867– . Ujuâts dagbøger fra Østgrønland 1894–1935; uddrag med en indledning og kommentar ved B. Rosenkilde Nielsen. 1957. 209 p. illus., ports, maps. (Grønlandske Selskab. Skrifter 19.) 55 refs. Text in Danish. ***Title tr.:*** Ujuât's diaries from East Greenland 1894–1935; extracts with an introduction and commentary by B. Rosenkilde Nielsen.

Contains selected day-to-day notes of Johan Petersen, called Ujuât by the Greenlanders; he was factor at Angmagssalik 1894–1909, 1911–14 and 1923–24, and at Scoresbysund 1925–26 and 1934–35, and his notes cover all aspects of life at these settlements. A short biography of

the author, whose father was Danish, mother Greenlandic, is given in the introduction. He took part in Gustav Holm and V. Garde's (so-called umiak) expedition of 1883–85, and from his intimate knowledge of East Greenland he made notable contributions to works dealing with the region. Nielsen's comments include information supplied by Petersen himself. The text has been edited and provided with additional commentaries by Dan Laursen. ***Copy seen:*** SPRI.

53954. PETERSEN, JOHANNES BOYE, 1887– . Studies on the biology and taxonomy of soil algae. (Dansk botanisk arkiv, 1935. v. 8, no. 9, p. 1–180, 7 illus., 41 tables.) 293 refs.

Attempt is made to give a more precise classification to the term "soil algae". In Danish soils, a subterranean algal flora is found on cultivated as well as uncultivated land. In East Greenland in absolutely virgin soil, subterranean algae are present. Seeping water, especially during showers, carries a large number of spores down into the soil, and the presence of earthworms aids the process. All the algae are not killed at the surface by frost and heat. The soil nutrients seem to determine the luxuriance of the algal vegetation. A sharp distinction must be drawn between the epiterranean and the subterranean algae; the former are producers, the latter, consumers. The algal flora of Danish soils, also the algae met with in East Greenland are listed with taxonomic and biological notes on each species.

Organizational and navigational aspects of ice-breaking and shipping in arctic seas are treated in detail. Information is presented on ice cover, preparation of vessels to withstand severe conditions, measures for prevention and repair of ice damage, etc. Symbols used to characterize ice in sailing charts are defined and illustrated (fold. plates, p. 24–25). Daily increase in ice thicknesses as a function of atmospheric temperatures is tabulated (p. 22–24). The development of ice-breakers and ice-strengthened ships from 1710 to the present is reviewed and details of cargo ships, tugboats and ice-breakers for arctic service are analyzed (p. 47–69), including a 7,500 t., 8,000 hp. diesel-electric ice-breaker. Signals and signalling procedures are outlined (p. 113–120). Convoying with ice-breaker escort is described, with consideration of such contingencies as relief from ice pressure, anchoring, docking, maneuvering, etc. Use of explosives in ice-breaking is discussed at length (p. 181–97). Rescue operations are dealt with (p. 221–37); responsibilities of the rescue vessel and the ship in distress are stated. Levy of rescue fees on Soviet and foreign vessels is explained and court rulings cited. Appendices present classification and terminology of sea ice, navigational regulations for ships being convoyed by an ice-breaker, and form of contract for rescue and collection of fees. ***Copy seen:*** DLC.

53972. PETROVSKIĬ, D. Nekotorye osobennosti ėkspluata t͡sii avtomobileĭ na Kraĭnem Severe. (Avtomobil'nyĭ transport, Jan. 1958. god 36, no. 1, p. 9–10, illus., table.) Text in Russian. ***Title tr.:*** Some features in the use of motor vehicles in the far North.

The problem of low temperature and wind effects on motor vehicle parts and on workmen is stated. The State Institute for the Development and Exploration of the Far North has tabulated meteorological conditions (temperature and wind) in relation to physical abilities for outside work. A temperature of −5° C. with wind of 20 m./sec. or a temperature of −40° C. and wind of 1 m./sec. are equally unsuitable for outside work. Various measures and materials required for engine starting, operation and storage are described. Arctic fuels Az-66 and A–74 are used for gasoline engines, and fuels AK_p–6, DA and D_p–8 for diesel engines. Special oil used for transmissions is diluted with 7–10% of fuel DA at temperatures below −30° C. Precautions are necessary to prevent snow from entering into fuel or oil tanks. Special frost-resistant tires are required to prevent cracking. Motor vehicles must be parked at least 6 m. apart and more than 40 m. must be allowed between rows of them. Drivers and maintenance crews must be well trained for arctic conditions. ***Copy seen:*** DLC.

Map of area 64°45′–65° N. 147°30′–148° W. in scale 1:63,360, contour interval 50 ft., based on work of 1947–1955. Formations are shown and other geologic features noted; cross-section shows map data and permafrost areas. General information is provided on location, human and geologic history, topography, climate, and foundation conditions result-

ing from permafrost. Geologic units, ranging from Precambrian Birch Creek schist to various unconsolidated Quaternary deposits like Fairbanks loess are described in tables, analyses of soil and aggregate samples are given, also selected subsurface data with reference to location on map. ***Copy seen:*** DGS.

53977. PÉWÉ, TROY LEWIS, 1918– . Permafrost and its effect on life in the North. (Biology Colloquium, 18th, 1957. p. 12–23, illus., diagr.) 115 refs.

Discusses perennially frozen ground and its effects on natural processes and man's activities based on observations at Fairbanks, Alaska. Distribution and types of permafrost are analyzed and their effects shown on the life of the area. A summary of Quaternary geology of the region is included as background for understanding present conditions; fossil flora and fauna of the frozen ground are described. The most important feature of permafrost is its ice content which hinders agriculture and construction because of subsidence caused when it melts. Its influence on vegetation, agriculture, ground water and engineering is examined, and the most important effects are summarized. ***Copy seen:*** DGS.

Describes advance of this 35-mile long glacier on the north flank of Mt. McKinley, Alaska Range. After 100 years of wasting downward, the lower part advanced at least 3.8 mi. between fall 1956 and the end of July 1957, becoming greatly thickened and more crevassed. The part of the glacier below Gunsight Pass subsided about 100 ft., and its surface has broad wavelike configurations. Other major glaciers in the area show no new activity, and climatic data indicate no long-term increase in precipitation. Much of the Muldrow glacial trough lies along a major fault.

53981. PHILLIPS, LAURENCE S. Preliminary report on Tuttle Lake area, Saguenay electoral district. Quebec, 1958. 8 p., fold map, table. (Quebec. Dept. of Mines. Geological Surveys Branch. Preliminary report, no. 377.)

Maps at scale 1 in. : 1 mi. and outlines the geology of this 183 sq. mi. area (52°30′–45′ N. 67°30′–45′ W.) in the vicinity of Mt. Wright, approx. 40 mi. southwest of Wabush Lake. The consolidated rocks, Precambrian, represent, in part, the metamorphosed southwesterly extension of the iron-bearing sequence of the Labrador Trough. Rock types, north to south, comprise biotite gneisses and migmatites, with amphibolites and granite gneiss; amphibolite-free biotite schists, gneisses and migmatites; iron formations, including quartzites and crystalline marbles; and hornblende-biotite gneiss. The structure of the area is complex and the rocks are folded into tight isoclinal and overturned folds, mostly trending north-northwest. Deposits of Pleistocene glaciers and direction of ice movement are

noted. Several grab samples containing 50% or more iron oxide were obtained from formations in the southern half of the area, possibly of economic value.

53983. PHILLIPS, ROBERT ARTHUR JOHN. The Eastern Arctic Patrol. (Canadian geographical journal, May 1957. v. 54, no. 5, p. 190–201, 13 illus., text map.)

Reviews early, primarily scientific, patrols (1884, 1885, 1887, 1897) and the regular patrols started in 1903 with the *Neptune*, carried on annually from 1922 with the *Arctic* 1922–1924, *Beothic* 1925–1931, *Ungava* 1932, *Nascopie* 1933–1947, and from 1950 with the *C. D. Howe*. The changing character of the North, and of the services provided by the Patrol is described. At present a three-month trip, beginning late June, is made with 25 officials representing Government departments. A typical administrative-scientific program carried out during a day at one of the settlements is described.

53986. PIERCE, JOE E. A statistical study of consonants in New World languages: I, introduction; II, data. (International journal of American linguistics, Jan. and Apr. 1957. v. 23, no. 1, p. 36–45; no. 2, p. 94–108, tables, graphs.) 16 refs.

Tests C. F. Voegelin's attempt to classify phonological systems on the basis of the number of stop consonants. The different kinds of consonants used in aboriginal American languages, including Eskimo, Tlingit, Haida, Athapaskan and Tsimshian are discussed, compared, tabulated and the percentile occurrence of consonants in each language graphed. This consonant grouping, corroborated by known phonological features, seems to indicate a new way to classify languages. ***Copy seen:*** DLC.

53987. PIERCE, JOHN H. Range extensions of certain plants on the Gaspé Peninsula. (Rhodora, Aug. 1936. v. 38, no. 452, p. 273–75.)

Contains an annotated list of 12 plants with distributional data. At least seven of them are extending into northern regions of North America and Greenland, and some, like *Draba nivalis*, are of circumpolar distribution.

53988. PIĬP, BORIS IVANOVICH. Kurilo-Kamchatskaîa ėkspeditsiîa prezidiuma Akademii nauk SSSR. (Akademiîa nauk SSSR. Vulkanologicheskaîa stantsiîa. Biûlleten', 1958. no. 27, p. 82–84, illus.) Text in Russian. ***Title tr.:*** The Kuril-Kamchatka Expedition of Presidium of the Academy of Sciences of U.S.S.R.

M. A. Lavrent'ev headed this expedition, explored the main thermal springs of Kamchatka and the Kuril Islands for potential power resources, July 6–Aug. 6, 1956. The party visited the Academy's Volcanological Station at Klyuchi and made trips to hot springs in the Klyuchevskiy Volcano area, to the Nachiki (approx. 53° N. 157°45′ E.) and Paratunka (52°29′ N. 158° E.) hot springs near Petropavlovsk, to the Pauzheta (51°28′ N. 156° 48′ E.) and Ozernoye (approx. 51°29′ N. 156°35′ E.) hot springs in southern Kamchatka, and to several thermal sources on the Kuril Islands. The area selected for experimental drilling in the Pauzheta River Basin was studied and the site was determined for the first hole. The importance of volcanological studies in Kamchatka, where one-eighth of the world's active volcanoes are located, is noted; need is stressed for modernizing the observations and for a second volcanological station at Petropavlovsk. ***Copy seen:*** DLC.

Describes a type of movement in rigid masses as studied by A. Bauer in Eqip Sermia glacier, West Greenland during Expéditions Polaires Françaises 1948–1953 (No. 38722, 33483), also in other glaciers outside the arctic area, and dis-

cusses its causes. This motion, observed between lateral mobile zones, is characterized by a very crevassed ice surface. The movement occurs when ice masses from large firn areas are pushed through narrow outlets (Greenland glaciers); when large accumulations of snow in the firn region of high-mountain glaciers produce large ice masses and force them through narrow valleys; and when firn masses and avalanches descend at high speed, the steep slopes of the firn region imparting a block movement to flat glacier tongues (Karakoram glaciers and Jostedalsbre in Norway).—From SIPRE.

Text in Russian. ***Title tr.:*** Formation and melting of ice in lakes and water reservoirs and calculation of freeze-up and ice-clearing dates.

A method of long-range forecasting is described, and the calculated dates are compared with long-period observations for various reservoirs in European U.S.S.R., including Kola Peninsula. The heat balance equation was solved on a day-by-day basis so as to account for variable meteorological factors. The water temperature reaches 0° C. within one-two days of freeze-up of the open area of a large reservoir 5–6 m. deep; narrow and comparatively deep reservoirs (9–16 m.) freeze up a few days before the water reaches 0° C. Dates of disappearance of ice, computed from the cold reserve in the air before melting, heat exchange of the ice-snow surface of the reservoir in spring, and standard meteorological observations appeared to be two-three days earlier than the observed dates.—From SIPRE.

Reports results of studies carried out in 1955–56 in areas of the Verkhoyansk Range adjacent to the Lena River basin. The root system of *Pinus pumila* Rgl. in these regions, is characterized by absence of a main root; its branch (and adventitious) roots penetrate the soil no deeper than 30–35 cm. and during the vegetation period, they never reach the permafrost layer; the radius of the root system is 3–4 times greater than the radius of the crown. The soil is described and problems of root growth are discussed. ***Copy seen:*** DLC.

54017. PLAFKER, GEORGE, 1929– , *and* **D. J. MILLER.** Glacial features and surficial deposits of the Malaspina district, Alaska. Washington, D.C., 1957. 15 p. 3 maps incl. 1 fold. (U.S. Geological Survey. Reports, open file series, no. 425.) 24 refs.

Preliminary map and report, outgrowth of field studies of bedrock geology made in the Survey's petroleum program. Map shows distribution and form of moraine, crevasses, vegetation cover, and other features on the surface of the glacier. Twelve types of surficial depos-

its are distinguished, according to inferred lithologic character, origin, relative age; areas of bedrock are shown. Text summarizes investigations, also recent history of glaciation and deposition in the district and adjoining Icy and Yakutat Bays. Position of ice fronts and coast line at two periods of glacial history are outlined on text maps. Malaspina Glacier, long regarded as the type example of the piedmont glacier, offers clues to the nature of glacier movement because of its strikingly developed morainic banding. ***Copy seen:*** DGS.

54018. PLAFKER, GEORGE, 1929– , *and* D. J. MILLER. Recent history of glaciation in the Malaspina district and adjoining bays, Alaska. (Geological Society of America. Bulletin, Dec. 1957. v. 68, no. 12, pt. 2, p. 1909.) Abstract of paper presented at the Eighth Alaskan Science Conference in Anchorage, Sept. 10–13, 1957.

Traces advance and retreat of Malaspina and other glaciers discharging into Icy and Yakutat Bays, inferred from field investigations, aerial photographs, historical records and radiocarbon dates. Includes advance, 600–1290 A D., in a nearly continuous tidal ice front from west of Icy Bay to southeast of Yakutat; recession, 1400–1700, to positions at or north of present; advance, 1700–1791, less extensive than earlier; recession of Yakutat Bay lobe and stagnation of Malaspina, 1791 to present, and recession of Icy Bay lobe from about 1905. Wood embedded in moraines, recording maximum advance, was radiocarbon dated at $1,200 \pm 160$ and 830 ± 160 years B.P. ***Copy seen:*** DGS.

54019. PLAFKER, GEORGE, 1929– , *and* D. J. MILLER. Recent history of glaciation in the Malaspina district and adjoining bays, Alaska. (Geological Society of America. Bulletin, Dec. 1958. v. 69, no. 12, pt. 2, p. 1700.)

Contains abstract of a paper presented at the Society meeting in Eugene, Oregon, Mar. 27–29, 1958. Traces advance and retreat of the Malaspina Glacier and glaciers discharging into Icy and Yakutat Bays, inferred from recent field investigations and study of aerial photographs, historical records, and radiocarbon dates. ***Copy seen:*** DGS.

54020. PLAKHOTNIK, A. Znachenie MGG dlîa moreplavaniîa. (Morskoĭ flot, Nov. 1958. god 18, no. 11, p. 20–22, map.) Text in Russian. ***Title tr.:*** The importance of the IGY to navigation.

Outlines oceanographic problems to be studied during the extended International Geophysical Year (1959). Soviet research vessels participating in the 1957/58 program are named; 1959 Northern Hemisphere activities are to be concentrated in the North Atlantic and North Pacific, where fisheries research is to be increased. In the Arctic shipborne research is supplemented by investigations at coastal stations. The status of programs initiated in 1955–56 is summarized. ***Copy seen:*** DLC.

(København. Statens byggeforskningsinstitut. Rapport nr. 6.) Text in Danish. ***Title tr.:*** Winter construction, investigations made by the Statens byggeforskningsinstitut [Danish National Building Research Institute] 1947–50.

Presents results of experiments at 75 construction sites and of some laboratory tests. Bricklaying, concreting, excavating, protection of workers, heating sources, temporary water piping, and artificial illumination are dealt with in turn. All phases of construction can be carried out in winter (average February temperature −1° C.), provided adequate protection procedures are observed. Economic aspects are discussed. Diagrams are presented for predetermining required temperature of concrete laid at air temperature of 0° to −15° C., and with varied insulation covering, also for the additional heat required to compensate for delay in covering.

Cherepanov. ***Title tr.:*** The results of coordinating and revision work in the central Taymyr Peninsula.

Reports final checking done in 1957 in preparation of the Taymyr geological map at scale 1 : 1,000,000 for publication. Some aspects of the geologic structure of the Taymyr folded zone are outlined. Distribution, thickness, lithology and faunal characteristics of Precambrian and Lower Paleozoic deposits are reviewed. ***Copy seen:*** DGS.

54032. POHJAKALLIO, ONNI. Samarbetsproblem för forsknings- och försöks-verksamhet rörande växtodling i norra Finland, Norge och Sverige. (Nordisk jordbrugsforskning, 1956. årg. 38, häfte 1, p. 20–29.) Text in Swedish. ***Title tr.:*** Co-operative research and experimentation on plant improvement in northern Finland, Norway and Sweden.

Agricultural area, soil, weather, and crops in arctic Finland are discussed. Recent researches at Inari, Sodankylä and elsewhere include studies of drainage, nutrient elements, diseases, insects, soil biology, and overwintering conditions for cultivated crops. Potatoes, wheat, rye, clover, and meadow grasses are grown successfully during long daylight with little temperature change, but summer frosts do periodic damage. The division of interests in research between the three countries and cooperation among their personnel are recommended. ***Copy seen:*** DA.

POHJANPALO, LIISA, *see* Kujala, V. V., *and others.* Agaricales. *1953.* No. 52545.

54033. POHLHAUSEN, HENN. Zum Problem der nordgermanisch-lappischen Beziehungen. Bonn, 1957. 23 p. illus., diagr. (Commentationes Balticae, 1955, *pub.* 1957. v. 3, no. 3, p. 97–117.) Approx. 30 refs. Text in German. ***Title tr.:*** The problem of north German-Lapp relations.

Postulates that since a large number of Lapp words relating to reindeer hus-

bandry are of old Germanic origin, reindeer breeding has been introduced by contact with ancient Germanic tribes. The prehistoric (bronze and iron age) distribution of reindeer in Eurasia is traced, the origin and migration of proto-Lapps discussed; the lexical composition of Lappish is indicated and five different theories stated upon the provenience of Germanic reindeer terminology in Lapp development. ***Copy seen:*** DLC.

54034. POIRIER, LOUIS J. Hypothalamus et thermorégulation chez le singe. (Union médicale du Canada, Jan. 1958. t. 87, no. 1, p. 4–9, illus., tables.) 19 refs. Text in French. ***Title tr.:*** Hypothalamus and thermoregulation in the monkey.

Destruction of the "autonomic" centers or of their efferent paths abolished the peripheral mechanism of cold-resistance through reduction of heat loss. Destruction of the "extra-sympathetic" centers, disturbed the peripheral mechanism of heat production. ***Copy seen:*** DNLM.

54035. POKROVSKAĬA, I. M., *Editor.* Atlas miot͡senovykh sporogopyl't͡sevykh kompleksov razlichnykh raĭonov SSSR. Moskva, Gos. nauchno-tekhnicheskoe izd-vo'lit-ry po geologii i okhrane nedr, 1956. 461 p. illus., diagrs. (10 fold.), tables incl. fold., 2 maps. (Vsesoi͡uznyĭ geologicheskiĭ institut. Materialy, nov. ser., vyp. 13.) 127 refs. Text in Russian. ***Title tr.:*** The atlas of Miocene spore-pollen complexes of different regions of the U.S.S.R.

Comprehensive work, prepared by ten scientists in 1951–52 from material brought to the Geological Institute Laboratory for pollen analyses. Miocene fossil flora are identified and treated fully. Pollen analyses serve mainly for stratigraphic characteristics of certain areas. The lower Ob' River (p. 50–52) and Podkamennaya Tunguska (p. 84–85) are described among other regions. The numerous maps cover broad arctic areas. Similar atlases for other geologic periods are planned. ***Copy seen:*** DGS.

54036. POKROVSKAĬA, NINA VASIL'EVNA. Agnostidy srednego kembriĭa ĬAkutii, chast' I. Moskva, izd-vo Akademii nauk SSSR, 1958. 96 p. illus., plates, table. (Akademiĭa nauk SSSR. Geologicheskiĭ institut. Trudy, vyp. 16.) 99 refs. Text in Russian. ***Title tr.:*** Agnostides of the Yakutia Middle Cambrian, part I.

Monographic study of Agnostidae trilobites collected in 1950–1951 by the author and others, in cross-sections of the Maya, Amga, Botoma and Lena valleys. Twenty species and one variety, representing eight genera, are described, two genera and ten species as new. The anatomy is treated comprehensively, comparison made with forms in Scandinavian countries and England. The importance of Agnostidae in the stratigraphy of the Middle Cambrian is stressed not only for the U.S.S.R., but the entire world. Foreign sources were consulted extensively. ***Copy seen:*** DLC.

54037. POKROVSKAĬA, T. N. O prichinakh obuslovlivaĭushchikh sovremennoe rasprostranenie navagi, rod *Eleginus.* (Zoologicheskiĭ zhurnal, Aug. 1958. t. 37, vyp. 8, p. 1181–94, illus. tables, map.) 41 refs. Text in Russian. Summary in English. ***Title tr.:*** Causes determining present distribution of the navaga, genus *Eleginus.*

Following an outline of the geographical distribution of this species of cod, the author analyzes the factors affecting it. One of them is low temperature of littoral waters during the winter necessary for reproduction. This is considered to be the cause of the species' not spreading into the Pacific south from Southeast Alaska and northern Korea. Scarcity of food is assumed to exclude the navaga from arctic Siberia and arctic Canada. ***Copy seen:*** DLC.

54038. POKROVSKAĬA, T. N. Vozrast i rost navagi Karskogo moriĭa. (Akademiĭa nauk SSSR. Institut okeanologii. Trudy, 1957. t. 20, p. 302–311, illus., tables.) 13 refs. Text in Russian. ***Title tr.:*** Age and growth of the navaga of the Kara Sea.

Reports investigation of the size of 24,000 and the age of over 6,000 specimens of *Eleginus navaga.* This cod-like fish was found to attain a length of 45 cm. and an age of 12 years. Fastest growth was calculated for the first three years of life, i.e., up to the attainment of sexual maturity. Seasonal growth was strongest during a six-week period (mid-September through October), being slow or non-existent during the rest of the year. ***Copy seen:*** DLC.

54039. POKSHISHEVSKIĬ, VADIM VĬACHESLAVOVICH. ĬAkutiĭa: priroda, lĭudi, khozĭaĭstvo. Moskva, Izd-vo Akademii nauk SSSR, 1957. 197 p. illus.,

511326—60——58

tables, maps incl. 2 fold. Errata slip. (Akademiîâ nauk SSSR. Nauchno-populîârnaîâ seriîâ.) Over 100 refs. Text in Russian. ***Title tr.:*** Yakutia: nature, people, economy.

Describes this republic of over three million sq. km., one-seventh of the area of the U.S.S.R., its population only 413,000 in 1939 (277,000 in 1911), i.e., 0.14/sq. km. Over 5 billion rubles has been sunk in its development since 1927. Information on the area as a whole is augmented by separate treatment of the sections (p. 119–91) viz.: central Yakutia, west of the Lena, the Aldan mineral development district, the northeast, the lower Lena and arctic coast. The physical character of the country is delineated in its geomorphology, rivers, lakes, mountains and climate; permafrost underlies most of the area; taiga forest is the dominant vegetation, with scattered small patches of meadow ("alass") and arable soil. The population is chiefly Yakuts; their history, material culture, and present acculturation are sketched: dwellings (modernized yurtas, p. 85–88), food, clothing, etc.; traditionally dispersed in small one–two family groups on the scattered meadows and arable ground, they have resisted recent concentration by collectivization and industrialization. The towns and "city-like" settlements of Yakutia are sketched: Yakutsk (with its remarkable growth, two higher schools, Branch of Academy of Sciences, etc.), Vilyuysk, Nyurba, Aldan, Ust'-Nera, Zyryanka, Khandyga (approx. 62°25′N. 135°30′E.), Sangar, Tiksi, Ambarchik, Russkoye Ust'ye, Olenek (approx. 68°40′N. 112°20′ E.), Saskylakh (71°58′N. 114°04′E.), etc. The main traditional occupation, animal husbandry, especially cattle and horse breeding, reindeer breeding in the North (p. 185–90) has been hampered by shortage of water and forage; fur farming, hunting and trapping, fisheries (development limited by scarcity of fish in northern waters) have also been carried on, and some attempts made to extend agriculture: 36,000 hectares of arable land in 1917, 108,000 in 1940 and only 80,000 in 1955. Timber and mineral resources are great; and development is noted of the wood industry, gold in the Aldan basin, coal mining at Sangar, Kangals and the Zyryanka River (left tributary of Kolyma at 65°34′N. 148°12′ E.) supplying the Northern Sea Route; also mica deposits in the Aldan area, salt springs and deposits and the diamantiferous fields in Vilyuy River basin; petroleum prospects and discovery of natural gas near the mouth of the Vilyuy River are mentioned. Advances in transportation are indicated by the transfer of river steamships in 1952 from the Sormovo shipyards via Northern Sea Route to the Lena River; the Tayshet-Ust'-Kut railroad, and new automobile roads; the Amur-Yakutia trunk line (AÎÂM) from Bol'shoy Never station on Siberian railroad to Aldan, and the Magadan-Khandyga road. Prospects of further development as conditioned by increase of population and improvement of transportation are discussed in conclusion (p. 192–95). To references in footnotes throughout, a selected list of 16 books is added. Folded map shows boundaries of Yakutia and its 36 districts, with location of the administrative centers.

54043. ***POLAR RECORD.*** Films on polar exploration and research. (Polar record, Sept. 1957. v. 8, no. 57, p. 542–56.)

Revision of list by Frank Bamping in *Scientific film review*, 1957, v. 3, no. 2, p. 53–68. Lists approx. a hundred films by title (many on the Arctic), noting size (mm.) and other features, also subject if not disclosed by title.

Copy seen: DLC.

54044. ***POLAR RECORD.*** The new constitution of the Scott Polar Research Institute. (Polar record, May 1957. v. 8, no. 56, p. 412–418.) *Also pub. as:* Cambridge University reporter, Dec. 12, 1956. v. 87, no. 15, p. 430–36.

This constitution is in force as of Jan. 1, 1957. Origin and history of the Institute, its organization and relation to the University, expenditures, future expansion and staff are outlined. The Institute has been made a sub-department within the University Dept. of Geography and the directorship and three other posts established as University teaching offices. A committee will advise the Director as to education, research, and cooperation with other bodies interested in polar research.

Copy seen: DLC.

54045. ***POLAR RECORD.*** News notes. (Polar record, 1957–1958. v. 8–9, no. 55–60.)

Events and other news of arctic interest, except expeditions, obituaries, ships (*infra*), are summarized as follows:

Arctic Research Laboratory of the U.S. Office of Naval Research at Pt. Barrow, Northern Alaska (no. 57, p. 558–59).

Arktisk Institut, Copenhagen, Denmark, which started operation in Oct. 1954, its Board of Directors, maintenance, library (no. 56, p. 453).

V. A. Obruchev Institute of Permafrost Studies in Moscow, with 170 technical and scientific workers in three departments (no. 55, p. 362–63).

Research Institute of Agriculture of the Far North, Leningrad, which employs about 150 scientific and technical workers and maintains field stations in the North to help collective farms (no. 55, p. 363–65).

Yakutsk State University opened Sept. 29, 1956, accepting 1,200 students, the majority belonging to minority peoples (no. 56, p. 455).

Karel'skaya A.S.S.R. approved by the Supreme Soviet as an autonomous republic within the Russian Soviet Federated Soviet Republic (no. 55, p. 365).

Soviet river ice conference held at Novosibirsk, May 7, 1957, at which ways of lengthening navigation season were noted and subjects for future research approved (no. 57, p. 559–60).

International Whaling Commission's eighth meeting, held in London July 16–20, 1956, with 17 contracting governments represented, and recommendations made concerning Blue Whale Units, seasons and areas for various types of whales (no. 56, p. 455–56).

Anglo-Soviet fisheries agreement signed in Moscow May 25, 1956, permits British fishing boats to approach within three mi. of specified areas in Barents Sea; other non-Soviet fishing boats must remain outside 12-mi. limit (no. 55, p. 366).

Eskimo resettlement at Resolute Bay, Cornwallis Island, with ten families from Port Harrison, Northern Quebec, and Pond Inlet, Baffin Island, moved during the Eastern Arctic Patrols of 1953 and 1955 (no. 55, p. 370–71).

Eskimo resettlement at New Thule (formerly Kanaq), northwest Greenland, about 100 km. north of former Thule (now U.S. Air Force base); construction during 1953–1954 described (no. 55, p. 368–70).

Greenland Constitution: changes during 1947–1955 (no. 56, p. 449–50).

Finnish-Swedish boundary inspection team during Aug. 1956 (first since 1926) made minor changes due to shifts of river channels (no. 57, p. 559).

Snow shoe of new design developed by

Statens Skogsforskningsinstitut for use in Swedish lumber work (no. 55, p. 367).

Norwegian arctic weather stations in Svalbard, Jan Mayen, East Greenland and northern Norway, with list of periodical publications of Norske Meteorologiske Institutt, Oslo (no. 56, p. 451–52).

Shipping movements in 1956 along the Northern Sea Route and ways in which the new Five-Year Plan would affect the Route (no. 56, p. 453–55).

Snow retention methods for Soviet farmers to protect soil from low temperatures and provide source of moisture (no. 57, p. 556–57).

Soviet methods (with diagram) of constructing ice cellar capable of holding 100 metric tons of foodstuffs; maintenance of cool temperatures in summer (no. 57, p. 557–58).

Eskimo bulletin pub. by the Canadian Dept. of Northern Affairs (irregularly), since 1953 and distributed to Eskimos, teachers, missionaries, and RCMP. detachments in Eskimo areas (no. 56, p. 456–57.)

Glaciers in arctic regions (no. 58, p. 32–36).

Conference 1955, on tree line growth in the Soviet Arctic (no. 58, p. 41–42).

Murmansk Biological Station (no. 58, p. 42–43).

Interim Convention on Conservation of North Pacific Fur Seals, Washington, D.C., 1957 (no. 58, p. 43–49).

Trans-arctic commercial flights between Europe and western U.S. by Pan American World Airways, and between Paris and Tokyo by Air France (no. 58, p. 49; no. 60, p. 266).

Mesters Vig, East Greenland lead and zinc deposits under development by Nordisk Mineselskab A/S (no. 58, p. 50–51).

Map of arctic IGY stations 1957–58 (no. 59, p. 149–50).

Co-ordinating Commission for Permafrost Studies attached to the V. A. Obruchev Institute 1957 (no. 59, p. 150–51).

Population statistics of 1956, for 13 towns in arctic U.S.S.R. (no. 59, p. 151).

Diamond deposits and kimberlite pipes similar to those of South Africa are found in Yakut A.S.S.R. and large-scale exploitation is planned (no. 59, p. 151–53).

Melting of ice by sprinkling it with dark material caused breakup at Arkhangel'sk 15–20 days early (no. 59, p. 153–54).

Research stations established since 1903 in north Norrland, Sweden: Abisko naturvetenskapliga station, botanical and zoological studies; Sareks naturvetenskapliga anläggningar, in Sareks national park, meteorology; Tarfaladalens glaciologiska observatorium, Kebnekaise area, carrying out a long-term glaciological program; and Kiruna geofysiska observatorium, ionospherics, seismology, cosmic rays, meteorology and geomagnetism (no. 59, p. 154–56).

Sea ice observations in waters between Svalbard and Greenland reported by Scandinavian Airlines System crews on their regular trans-polar flights; photographs are taken in flight (no. 59, p. 156).

Canadian Joint Committee on Oceanography has a working group 1957, to coordinate government studies of ice in navigable waters, its objectives (no. 59, p. 156–57).

Dewey Soper Bird Sanctuary established 1957 on Baffin Island breeding grounds of geese includes the 500 sq. mi. Bowman Bay Game Preserve (no. 59, p. 157).

Arctic Sea Ice Conference at Easton, Maryland, 1958, its program (no. 60, p. 264–65).

Kara Sea Route voyages 1953–57, by non-Soviet ships, loading timber at Igarka (no. 60, p. 266).

Defence Research Northern Laboratory established 1947 at Churchill, Canada, concerned with effects of arctic environment on the performance of men and materials (no. 60, p. 266–67).

Copy seen: DLC.

54046. ***POLAR RECORD.*** Notes on expeditions, exercises, projects, patrols, etc. (Polar record, 1957. v. 8, no. 55–57).

Summary account is given of the following:

Soviet High Latitude Air Expeditions, 1948–56, in the Arctic Basin (no. 55, p. 346).

Soviet oceanographic expeditions, Aug.–Oct. 1955 in the *Fedor Litke* in the area 82°–83° N. 53°–65° E. and in Svalbard waters, and the *Ob'* Aug.–Sept. 1956 in Greenland Sea, both led by L. L. Balakshin of the Arctic Institute, Leningrad (no. 55, p. 347; no. 57, p. 519); voyages of the R/V *Vitiaz'* in the Bering, Okhotsk, and Japanese Seas, 1949–55 (no. 55, p. 346).

Soviet drifting stations North Pole-4, -5, -6, and -7 in the Arctic Basin, with note on 15 automatic weather stations to

be put on the ice in summer 1957 (no. 55, p. 350–51; no. 57, p. 519–20, 521).

Danish geological, glaciological, and botanical work in West Greenland, June–Oct. 1955, and geological, paleontological, archeological and zoological work by Danes, Swiss, and British in East Greenland, July–Sept. 1955 (no. 55, p. 347–48).

Preliminary Danish glaciological studies, in connection with the IGY in Upernavik and Inglefield Bredning areas of West Greenland, June–Aug. 1956 (no. 56, p. 447).

Helicopter operations in the Mesters Vig area, northeast Greenland, including transport of prospectors, equipment and supplies, reconnaissance flights, contracted for by Nordisk Mineselskab A/S of København, July–Sept. 1956 (no. 57, p. 520).

Six-man Scandinavian archeological expedition to Vestspitsbergen, July–Aug. 1955, working at Russekeila, Randvika, and Festningen where 17th and 18th century objects were found (no. 55, p. 348–49).

Scandinavian Airlines System transarctic commercial flights during 1954–57 (no. 57, p. 520, 522).

Five-man Oxford University Expedition to West Greenland, July–Sept. 1956, led by M. F. W. Holland, which carried out geomorphological and glaciological work on Sukkertoppen icecap (no. 56, p. 448).

Cambridge survey in central Vestspitsbergen, June–Aug. 1955, consisting of topographic, geologic, and survey work by four members of the Cambridge Spitsbergen Physiological Expedition, Cambridge North Ny Friesland Expedition and Oxford University Expedition to Nordaustlandet (no. 55, p. 349).

Cambridge University and Marlborough College Expedition to North-East Greenland (six-man party) which ringed and observed barnacle and pink-footed geese in the Hold with Hope area, Aug. 1956 (no. 55, p. 349–50).

Cambridge Spitsbergen Expedition (two-man party) which carried out geological and survey work in Ny Friesland, May–Sept. 1956 (no. 55, p. 350).

Plankton studies by P. S. B. Digby and Mrs. Digby, July–Aug. 1956, in Sørgattet, Vestspitsbergen, continuing work done at Isfjorden in 1948 and at Scoresby Sund, East Greenland in 1950–1951 (no. 55, p. 351).

Four-man French Expedition to Central Greenland, 1956–1957, led by J. Dumont and sponsored by Expéditions polaires françaises, which will winter on the ice at approx. 71°20′ N. 33°55′ W. and return to coast on foot June 1957. Party was dropped by parachute and supplied by air (some details given) (no. 56, p. 447–48).

Caribou investigations in northern Yukon in 1953, Baffin Island 1954, and detailed re-survey of Mackenzie, Keewatin and Saskatchewan in 1955 gave new estimated total of 277,000 head, a decline of 60% since 1950. In spring 1956, survey of Mackenzie District showed 80,900 wintering caribou compared to 96,900 estimated for previous winter (no. 55, p. 371–72).

Bering Sea Patrol by the U.S. Coast Guard, 1895–1955 (no. 55, p. 372–73).

IGY stations north of the Arctic Circle in Canada, Alaska, Greenland, Finland, Norway, Svalbard, Jan Mayen, Sweden, and drifting stations in the Arctic Basin. Soviet stations are not given; also expeditions in connection with the IGY Swedish-Finnish-Swiss expedition to Nordaustlandet, which will study meteorology and cosmic rays; Polish glaciological expedition to Hornsund region of Vestspitsbergen; Canadian glaciological expedition to Lake Hazen area of northern Ellesmere (no. 56, p. 445–47).

Copy seen: DLC.

54047. ***POLAR RECORD.*** Notes on expeditions, exercises, projects, patrols, etc. (Polar record, 1958. v. 9, no. 58–60.)

Summary account is given of the following:

Canadian Geological Survey investigations in the northern Foxe Basin area in 1956 by R. G. Blackadar and J. Pirrit, in 1957 by R. G. Blackadar (no. 58, p. 23; no. 60, p. 241); on Ellesmere and Axel Heiberg Islands by R. Thorsteinsson with E. T. Tozer in 1956, and with R. H. Janes in 1957 (no. 58, p. 23; no. 60, p. 240).

Operation Hazen 1957, part of the Canadian IGY program, to carry out over two summers and one winter meteorological, glaciological, and geological studies on northern Ellesmere (no. 58, p. 26–27).

Swedish-Finnish-Swiss Expedition to Nordaustlandet, 1957–1958, its 1957 activities (no. 58, p. 24–25).

International Glaciological Expedition to Greenland, 1957–1960, sponsored by the International Commission on Snow and Ice in connection with the IGY, Denmark, France, Germany and Switzer-

land participating, its reconnaissance activities in 1957 (no. 58, p. 25–26).

Brooks Range Project 1955–1956, of the U.S. Geological Survey: topographic mapping in Alaska north of 66° N. (no. 59, p. 138).

USS. *Nautilus*, atomic submarine 1957 cruise with 5½ days under ice in the Arctic Basin and reaching 87° N. (no. 59, p. 143).

U.S. Navy hydrographic surveys in the Canadian Western Arctic 1957; completion of a Northwest Passage (no. 59, p. 146–47).

U.S. drifting stations Alpha and Bravo in the Arctic Basin 1957–1958, as part of the IGY program (no. 60, p. 241–42).

Danish scientific work 1956 in West Greenland: geological, geophysical, glaciological, botanical, paleontological and archeological studies, and in East Greenland: continuation of geological investigations by L. Koch's party, and studies in paleontology and botany (no. 59, p. 138–39).

Norsk Polarinstitutt expeditions to Svalbard 1956 and 1957 with work programs consisting of topographic surveys, glaciology, ornithology and geology studies, hydrographic surveys, aerial photography, and a magnetic survey (no. 59, p. 139–40); also the Institute's relief expeditions to Jan Mayen, Myggbukta and northeast Greenland on the Polarbjørn in 1956 and 1957 (no. 59, p. 140).

Oceanographic work in Barents Sea and north of Spitsbergen (70°26′–80°24′ N. 12°10′–41°50′ E.) by a party from the Finnish Institute of Marine Research traveling on the *Aranda*, during which 55 hydrographic and 270 bathythermograph stations were worked, salinity and other chemical determinations made (no. 59, p. 142).

Swedish glaciological expedition in the Murchisonfjorden area of Nordaustlandet in 1957, to be extended in 1958 (no. 59, p. 142–43).

Botanical and zoological work on Bjørnøya 1957, by a Tromsø Museum party (no. 59, p. 143).

North Sweden Research Group of London University, its activities 1956 and 1957, establishing ground control points for a map to be plotted from air photos of mountainous area between Katterjaure and Sjangeli, 68°20′ N. 18°20′ E. (no. 59, p. 140).

University of Durham Exploration Society's Expedition to study the geography, geology, glaciology and zoology of the Lyngen area in Norway (no. 59, p. 140–41).

Cambridge Spitsbergen Expedition 1957, to extend geological and topographic survey of north Dickson Land begun by the 1953 Cambridge University Geological Expedition (no. 59, p. 141); continued in north Vestspitsbergen by C. B. Wilson, also of Cambridge University (no. 59, p. 142).

Nottingham University Exploration Society's Expedition to carry out physiological, geological, botanical and ornithological studies north of Kongsfjorden, Vestspitsbergen in 1957 (no. 59, p. 141).

Queen's University (Belfast) Expedition 1957 for geological and topographic work in Vestspitsbergen (no. 59, p. 141).

Reading University Zoological expedition to West Greenland 1957 (no. 59, p. 141–42).

H. I. Drever's geological study on Ubekendt Ejland, West Greenland continued 1957 (no. 59, p. 143).

Soviet drifting stations North Pole 6 and 7 (no. 60, p. 242).

Copy seen: CaMAI.

54048. ***POLAR RECORD.*** Notes on ships. (Polar record, 1957–1958. v. 8–9, no. 55–60.)

Construction, current activities, and other news is reported of the following vessels:

Canadian Hydrographic Survey vessel *Baffin*, launched June 18, 1956, especially designed for work in the Arctic; accommodates 102 persons (no. 57, p. 560–61).

British royal research ship *John Biscoe*, launched June 11, 1956, with range of 20,000 mi., accommodation for 34 passengers, 33 crew. The former *John Biscoe* is now HMNZS. *Endeavour* (no. 55, p. 374).

Construction of icebreakers by Wärtsilä-Koncernen A/B Sandvikens Skeppsdocka, Helsinki, for Finland, U.S.S.R., Sweden (no. 55, p. 366).

Danish transport vessel *Magga Dan*, launched June 1, 1956, for cargo service in the Arctic and Antarctic, with range of 16,000 mi., cargo capacity 63,000 cu. ft., accommodation for 35 passengers, 26 crew (no. 55, p. 373–74).

Loss of Danish naval cutter *Ternen* with eight men, in Greenland waters about Jan. 25, 1957; 82-ton vessel, presumed to have capsized suddenly due to heavy icing, later found sunk in the harbor of Ravns Storø, southwest Greenland (no. 57, p. 560).

Norwegian vessel *Jopeter*, lost in Greenland Sea, Sept. 13, 1955, was sighted by the Lauge Koch expedition in 1956 in Mountnorris Fjord, Traill Ø, refloated in Aug. and returned to Norway (no. 56, p. 456).

Trawler *Cape Trafalgar* built by Cook, Walton and Gemmell Ltd., Hull, England; incorporates design modifications based on results from experiments (described) on icing conditions (no. 58, p. 36–39).

Loss of the Norwegian sealer *Polarbjørn* Aug. 1957, in ice off northeast Greenland (approx. 73° N. 20° W.) on annual relief of stations on East Greenland; the '23 men aboard were evacuated by a U.S. Air Force helicopter from Thule (no. 58, p. 51–52).

Launching at Leningrad, Dec. 5, 1957, of the atomic icebreaker *Lenin* (no. 59, p. 154). ***Copy seen:*** DLC.

54049. ***POLAR RECORD.*** Obituaries. (Polar record, 1957–1958. v. 8–9, no. 55–60.)

Brief obituaries are given for:

Ove Balthasar Bøggild, 1872–1956, Danish authority on Greenland mineralogy, during 1913–1953 a member of Kommissionen for Videnskabelig Undersøgelser i Grønland (no. 56, p. 466).

Hans Bogen, 1899–1957, historian of Norwegian whaling and biographer of Lars Christensen (no. 59, p. 161).

Robert Neal Rudmose Brown, 1879–1957, British botanist and geographer and authority on Svalbard (no. 56, p. 466–67).

Rear-Admiral Richard Evelyn Byrd, 1888–1957, American explorer and aviator in the Arctic and Antarctic who flew over the North Pole in 1926 (no. 57, p. 562; no. 58, p. 54–55, port. facing p. 54).

Hallvard Ophus Devold, 1898–1957, Norwegian who played a part in the dispute between Denmark and Norway over East Greenland (no. 59, p. 161).

Wilhelm Filchner, explorer who led an expedition to Spitsbergen in 1910, died at 79 in May 1957 (no. 58, p. 56).

Lorentz Peter Elfred Freuchen, 1886–1957, Danish explorer, adventurer and writer, helped Rasmussen found Thule in 1910, participated in Mylius-Erichsen's expedition 1906–1908, and the First and Fifth Thule Expeditions, 1912 and 1921–1924 (no. 58, p. 56).

Johannes Grøntved, 1882–1956, Danish botanist who made studies in Greenland (no. 58, p. 56).

Helmer Julius Hanssen, 1870–1956, Norwegian sailor and polar explorer with the *Laura* expedition to Novaya Zemlya in 1897, *Gjøa* 1903–1906, and *Maud* 1918–1920 (no. 55, p. 377).

Frederick Lynge, 1889–1957, Greenlander, elected representative 1953, in the Danish folketing (no. 59, p. 161).

Leo Manning, died at 55, Mar. 1958, Canadian authority on the Eskimo language (no. 60, p. 271).

Hugo Holten Møller, 1900–1956, responsible for radio organization in Greenland, in 1946 and later director of electrification program there (no. 55, p. 377).

Vladimir Afanas'evich Obruchev, 1863–1956, Russian geologist and pioneer in permafrost studies, Director of the Institute of Permafrost Studies of the Academy of Sciences U.S.S.R. from 1930 (no. 55, p. 377).

Morten Pedersen Porsild, 1872–1956, Danish botanist, archeologist and ethnologist, who established Den Danske Arktiske Station at Disko in 1906, and directed it until 1946 (no. 55, p. 377–78).

Just Knud Qvigstad, 1853–1957, Norwegian philologist, ethnographer who studied Lapp culture (no. 58, p. 57).

Otto Ûl'evich Shmidt, 1891–1956, Russian scientist and leader of, among others, the Sibirîakov expedition 1932 and *Chelûskin* 1933–1934, and the North Pole expedition 1937–1938; Director of the Arctic Institute Leningrad 1930, and head of the Northern Sea Route Administration 1932–1939 (no. 55, p. 378).

Fredrik Carl Mülertz Størmer, 1874–1957, Norwegian astro-physicist and mathematician of aurora, who devised method of determining heights and positions of aurora by photographic means (no. 58, p. 57).

Harald Ulrik Sverdrup, 1888–1957, Norwegian meteorologist and oceanographer, chief scientist on the *Maud* expedition 1918–1925, the *Nautilus* 1931, etc., Director of Norsk Polarinstitutt, 1948 (no. 58, p. 57–58).

Joseph Burr Tyrrell, 1858–1957, Canadian geologist who explored and mapped large and hard-of-access areas of the North (no. 60, p. 271).

Copy seen: DLC.

54050. POLGE, C. Low-temperature storage of mammalian spermatozoa. (Royal Society of London. Proceedings, 1957. ser. B, v. 147, no. 929, p. 498–508, tables.) 46 refs.

Information is presented on species

variation in resistance of spermatozoa to deep-freezing (−79° C. and below); protective action of glycerol; the importance of equilibration; rate of freezing and thawing. A critical temperature range (−15° to −25° C.) was found in which the greatest damage to spermatozoa occurs; means to reduce it are discussed. ***Copy seen:*** DNLM.

54051. POLHEMUS, WILLIAM L. A simplified method of pressure pattern navigation. (Navigation, Winter 1957–58. v. 5, no. 8, p. 401–407, graphs, table.)

Contains a table and corresponding descriptive graphs to facilitate the determination of Bellamy drift and pressure lines of position at latitudes from 30° to 85° with 5° intervals and speeds from 180 to 600 knots with 10 knots intervals. By use of the graphs, in-flight work is reduced to one simple multiplication or division. ***Copy seen:*** DLC.

54052. POLÎAKOV, A. Zashchitnye lesopolosy v raĭone Salekharda. (Sel'skoe khozîaĭstvo Sibiri, 1958, no. 11, p. 32–36.) Text in Russian. ***Title tr.:*** Forest shelter belts in the Salekhard area.

Reports experiments carried out by the Yamal (Salekhard?) Agricultural Experimental Station in 1954–56 to improve microclimatic conditions of cultivated fields by protecting them from wind. The best results were obtained with shelter belts of Siberian larch, mountain ash, birch (*Betula pubescens*), osier, raspberry-cane, black currant; four-row belts slowed considerably the wind velocity to a distance of 7–12 times of their height, contributing to an even distribution of snow in winter and improved conditions of thaw and soil in spring and summer. Climatic conditions of the area are noted: a mean annual temperature −4.8° to −7.4° C. with 79° amplitude of fluctuation, −46.7° minimum and 31.4° C. maximum; 108 frost-free days, with 11.4° C. mean daily temperature during the vegetation period; 409 mm. of annual precipitation, etc. ***Copy seen:*** DLC.

54053. POLÎAKOV, IL'Î MIKHAĬLOVICH, *and* **E. I. POPOVA.** Vsesoîuznyĭ institut zashchity rasteniĭ. (Vestnik sel'skokhozîaĭstvennoĭ nauki, Feb. 1958. god 3, no. 2, p. 33–40.) Refs. Text in Russian. Summary in English and in German. ***Title tr.:*** All-Union Institute of Plant Protection.

Reviews the organization and activities of the All-Union Scientific Research Institute of Plant Protection (VIZR), founded in 1929: its leading scientists, laboratories, investigation of plant pests and diseases, development of insecticides, fungicides, herbicides and mechanical methods for their application. The Institute maintains 320 observation posts in all parts of the U.S.S.R., and has a unique mycological herbarium. Its work on protection of vegetables in the northwestern European part of the Soviet Union is mentioned. ***Copy seen:*** DLC.

54054. POLÎAKOV, S. S., *and* **E. M. SERGEEV.** Inzhenerno-geologicheskaîa kharakteristika doliny r. Ob' v ee nizhnem techenii. (Nauchnye doklady vysshel shkoly. Geologo-geograficheskie nauki, 1958, no. 1, p. 124–32, map.) Text in Russian. ***Title tr.:*** Engineering-geological characteristics of the lower Ob' River valley.

Presents results of investigation of the Ob' valley from Salekhard up to Khanty-Mansiysk in "last four years" by the Ministry of Electrical Stations and Moscow University in view of hydroelectric construction eventually. Geological structure of the upper strata of three main parts of the valley is outlined: a glacial "plateau", 60-100 m. above the water level, extending along the right bank from the Kazym to Nazym River mouths (63°50′–61°15′ N.) and in the region of Salekhard and Labytnangi (p. 124–28); an alluvial plain, 35–45 m. high, with many lakes on both sides of the Ob'; the river valley proper, including its flooded areas (p. 129–30). Special attention is paid to ground formations and to occurrence of permafrost. A schematic text map of the valley is included. ***Copy seen:*** DLC.

54055. POLÎANICHKO, ÎAKOV IVANOVICH, *and others.* ÎUbileĭnaîa nauchnaîa sessiîa Karel'skogo filiala AN SSSR. (Akademiîa nauk SSSR. Karel'skiĭ i Kol'skiĭ filialy. Izvestiîa, 1958, no. 2, p. 117–81.) Text in Russian. *Other authors:* I. V. Il'ina, G. N. Makarov, *and* A. A. Romanov. ***Title tr.:*** Jubilee scientific session of the Karelian Branch of the Academy of Sciences of the U.S.S.R.

Reports the scientific session, Oct. 28–29, 1957 (in Petrozavodsk?), celebrating the 40th anniversary of the Soviet regime. Papers delivered by V. S. Slodkevich, chairman of the Branch Presidium and other scientists, stressed the scientific, cultural and industrial development of Karelia; and a special exhibition was

prepared by institutes and divisions of the Branch, to illustrate the progress of scientific exploration in Karelia.

54059. POLKANOV, ALEKSANDR ALEKSEEVICH, 1888– , *and* E. K. GERLING. K–A and Rb–Sr methods and age of Precambrian of USSR. (American Geophysical Union. Transaction, Aug. 1958. v. 39, no. 4, p. 713–15, table.) 9 refs.

Contains tabulated data on 35 age determinations by these methods, including such of minerals from locations in Siberia and Kola Peninsula. Ages range from 500–2880 million years; the oldest rocks were found on Kola. Great difference in the age of some rocks as determined by the K-A method, and the geological data, is not believed due to incorrectness of the K-A method.

54060. POL'KIN, ÎA. I. K voprosu o proiskhozhdenii izvestniîakov iz ėffuzivnogo kompleksa trappov severa Sibirskoĭ platformy. (Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Informat͡sionnyĭ bûlleten', 1958. vyp. 9, p. 18–23, table.) Text in Russian. ***Title tr.:*** On the question of the origin of the limestone of the effusive trap complex in the northern part of the Siberian platform.

Widespread effusive traps in the northern part of the Siberian platform are distinguished in several series, which are reviewed. In this complex a light-gray limestone occurs in various localities, including the Kureyka, Gorbiyachin, Kotuy Rivers and Lake Ayan (approx. 68° N. 90–95° E.). Its appearance in lenses and seams is described and chemical analyses are presented. Hitherto this limestone has been held of lacustrian origin. On the basis of 1955–57 field study, the author reconsiders and offers his opinion that its origin is connected with active hydrothermal waters.

A study of plant material collected in 1952, 1953 and 1955 on or near the surface of so-called Fletcher's Ice Island, approx. 11½ by 6 mi. in size, drifting clockwise in the Canadian-Alaskan sector of the Arctic Basin. The material was from the following plants: *Salix arctica* (531 items), *Saxifraga oppositifolia* (164 items), *Poa abbreviata* (20 partial specimens), *Saxifraga caespitosa* (7 rosettes), various leaves and roots, lichens, mosses and liverworts. Collecting sites, location, substrate, etc., are indicated on map. All specimens except a mat of moss, were dead. Most of these land-grown forms are of high arctic origin. Aero-palynological studies on T–3 gave meager and inconclusive results.

Outline on geology of the country; kinds and composition of parent mineral material, mechanical and chemical properties of soils, soil development in relation to relief, climate and vegetation.

Two profiles are presented, of the upper Vychegda and middle Sysola, as characteristic of soil development in the valleys of Komi A.S.S.R. For mechanical and chemical characteristics of the soils, some 300 analyses are reviewed and summarized in tables; mechanical composition in the 0–20 cm. and 20–100 cm. horizons is tabulated. Mechanical composition of the soils is shown (p. 22) in relation to area and percentage of occupied territory of Komi A.S.S.R. Relief, temperature, precipitation, the vegetation period, permafrost, and snow cover are discussed as factors in soil building; conditions in the Vychegda-Mezen' and Pechora lowlands, Polar Ural and other northern parts of the district are cited among others. ***Copy seen:*** DGS.

54069. POLYNTSEVA, OL'GA AFANAS'EVNA, *and others.* Opisanie pochv. (*In:* Akademiia nauk SSSR. Komi filial. Pochvy Komi ASSR, 1958. p. 29–144, tables, diagrs.) Text in Russian. *Other authors:* I. V. Zaboeva, L. A. Makarova, L. A. Verkholantseva, N. V. Chebykina, D. M. Rubtsov, *and* T. A. Stenina. ***Title tr.:*** Description of soils.

Soils of Komi A.S.S.R. are divided into types, subtypes and forms and described in detail: stages of the horizons, kind of soil, organic matter (microorganism, humus formation, its quantity), mechanical and chemical composition, acidity, porosity, weight and other characteristics. The main soil types are: tundra, podsolic, peat-carbonate, peat-gley, podsolic-marshy, marshy, marshy tundra, fluviogenetic, arable. Komi A.S.S.R. extends about 1000 km. north–south, and the soils range from arctic tundra in the north to podsolic soils in the south; climate is the major factor in forming the soil belts. Considerable attention is given to tundra soils (p. 32–54); of which eight different forms are represented in Komi A.S.S.R., shrubby tundra soil (with *Betula nana,* etc.) the most prevalent; together they cover 5% of the territory. The main features of tundra soil formation generally are a moist horizon near the surface, which leads to the destruction of soil by the frost and heaving; mechanical shifting of soil material upward; poverty of biotic elements; relatively low mineralization. Topography is discussed as important in the tundra soil formation. Profiles of the different soil types, mechanical and chemical composition in various horizons, nature and extent of the microflora, and humus formation are included. Tundra soils are little explored as yet and some aspects are still unknown. ***Copy seen:*** DGS.

Kol'skiĭ filial.) 91 refs. Text in Russian. ***Title tr.:*** Soils of the southwestern part of the Kola Peninsula.

Presents the results of comprehensive investigations in 1938–1940 of the soils in the Lake Imandra depression and in the vicinity of Kapustnyye and Voron'i lakes (approx. 67°20′–67°40′ N. 30°20′–34°20′ E.). Climate, geologic structure, and vegetation are reviewed, as factors in soil formation, and the types of soils for plains, and mountain regions are described. Mountain soils include tundra, podsols and peat soils. Podsolic, podsol-swamp, bogland, and flood-plain soils developed on plains are treated in detail, as characteristic of the area studied. Soil reaction, classification of minerals, causes of acidity or alkalinity, organic matter, moisture, physical and other properties of soil type are dealt with. Data are given in tables.

Describes a diamond crystal from the collection made by L. A. Popugaeva in the breccia of "Udachnaya" on the right bank of the Daaldyn River in the Olenek basin. Appearance, structure and component rocks of the kimberlite pipe are outlined. The diamond, measuring 0.5 x 0.3 x 0.2 cm., is treated in detail. Its form, facets, index of refraction, illumination and other properties are reported; its similarity to South African diamonds is stressed. ***Copy seen:*** DGS.

54093. POPULATION REFERENCE BUREAU, *Washington, D.C.* Alaska, a population profile. Washington, D.C., June 26, 1958. 3 p. Mimeographed.

Analyzes Alaska population data in comparison with the rest of the country: density about one person/four sq. mi. (57/sq. mi. average for the U.S.); Alaska has three country dwellers to one city resident; U.S. ratio is two city dwellers to one rural. Alaska has the most youthful population (median age of 26), the largest proportion of males to females, highest proportion of married women; highest birth and lowest death rates. Percentage of population increase is higher than for any state except Nevada which is the same. ***Copy seen:*** CaMAI.

54094. PORENIUS, PER. Västernorrlands jordbruk minskas. (Skogen, *Stockholm*, May 1, 1957. årg. 44, nr. 9, p. 310.) Text in Swedish. ***Title tr.:*** Agriculture in Västernorrland is declining.

Reports investigation of the status and potentials of agriculture and forestry in this county in northern Sweden. Both industries, now in decline, need to be modernized and put on an economic basis, and regulation of timber lots through sale or exchange is a precondition for development of forestry.

54095. PORFIRIDOV, NIKOLAÏ GRIGOR'EVICH, 1893– . Nadpisi na nozhakh russkikh morekhodov xvii v. (Sovetskaîa arkheologiîa, 1958, no. 2, p. 267–69, illus.) 8 refs. Text in Russian. ***Title tr.:*** Inscriptions on knives of Russian 17th century seafarers.

Disputes V. V. Gelman's (No. 35857) reading of the inscriptions on two 17th century knife handles found in 1941 on the eastern shore of Taymyr Peninsula. The first word deciphered as "murmz" i. e. from Murman, should be read as "purt", i. e. Zyryan knife, a trading staple at Mezen' and Mangazea. This suggested reading would weaken the hypothesis of the expedition's Murman origin. ***Copy seen:*** DLC.

54096. PORKHAEV, G. V., *and* **S. G. TSVETKOVA.** K voprosu ob èksperimental'nykh metodakh opredeleniîa osadki mnogoletnemerzlykh dispersnykh gruntov pri ottaivanii. (Akademiîa nauk SSSR. Institut merzlotovedeniîa. Trudy, 1958. t. 14, p. 64–69, tables, graphs,

diagr.) 3 refs. Text in Russian. ***Title tr.:*** Experimental methods of determining the settling of permanently frozen dispersed soils by thawing.

Laboratory tests on undisturbed samples of frozen clay and sandy soils were made by odometers (6.2–8 cm. diam., 4.5 cm. high) at 10°–13° C. and a load of 0.05 kg./sq. cm., and visually on 30 x 30 x 40 cm. stratified samples placed in wooden boxes. The settling of clay soil of 30–50% moisture content recorded with the odometer reached 20–50%, while that of sandy loam and sand (16–32% moisture) did not exceed 1–12%. Settling proceeded more evenly in sandy than in clay soils; stability was reached after 3–5 and 2–4 hr. respectively. Stratified samples of clay and sand, and clay, ice, and sand, settled an average of 12.5% and 23.5% when subjected to surface thawing at 4°–10° C. The settling of soil in 6 x 6.5 m. plots in the field averaged 14 cm. for a thawed depth of 56 cm. Laboratory and field values are compared and evaluated.—From SIPRE.

Trudy, 1958. t. 14, p. 80–91, table, graphs.) 2 refs. Text in Russian. ***Title tr.:*** Determination of the thermal conductivity coefficient of soils from data of observations under natural conditions.

Nomograms and formulas are given for determining the coefficient and various parameters in frozen ground based on observed temperature distribution within the active layer in early summer, when the soil is still under the influence of winter cooling, and in autumn and winter before the active layer wholly freezes. Data on observed and calculated soil temperatures and thermal conductivities in various months are tabulated.—From SIPRE. ***Copy seen:*** DLC.

54098. PORKHAEV, G. V. Zaankerivanie fundamentov v talom grunte. (Akademii͡a nauk SSSR. Institut merzlotovedeniĭa. Trudy, 1958. t. 14, p. 56–59, table, diagrs.) 3 refs. Text in Russian. ***Title tr.:*** Anchoring foundations in thawed ground.

A method of computing the anchoring forces required to counteract heaving of foundations laid below the freezing layer in areas of deep frost penetration is described. The forces are calculated under the assumptions that the pressure at the contact surface between frozen and unfrozen ground is equal to that of the entire layer of seasonal freezing, that the unfrozen layer is underlain by an infinite mass of frozen ground, and that frozen ground is incompressible. A sample calculation for a reinforced concrete foundation with a square anchor is presented.—From SIPRE. ***Copy seen:*** DLC.

54099. PORKKA, M. T., *and* **E. E. VESANEN.** Earthquake in Ranua and Pudasjärvi 1956. (Geophysica, 1958. v. 5, no. 4, p. 226–29, tables, map.) 6 refs.

On Dec. 24, 1956, an earthquake was recorded at Sodankylä (67°26′ N. 26°34′ E.) at a southward epicentral distance of 1°.5. It was felt over an area of approx. 7,500 sq. km. extending 130 km. north-south and with macroseismic epicentrum at 65°.7 N. 27°.4 E. Data on the foreshocks, main shock, and aftershocks, also distances from three seismic stations in Finland and one in Sweden, are tabulated. The microseismic data made it possible to estimate roughly the thickness of the earth's crust in northern Finland: 30–40 km.; this is less than in northern Sweden. ***Copy seen:*** DLC.

54100. PORSILD, ALF ERLING, 1901– . Illustrated flora of the Canadian arctic archipelago. Illus. by D. T. Lid. Ottawa, 1957. iii, 209 p. 70 illus., 332 text maps (Canada. Dept. of Northern Affairs and National Resources. National Museum of Canada. Bulletin no. 146, Biological series no. 50.)

Basic reference work. A survey of the physiography, soils and plant habitats of the region (p. 1–10), introduces a systematic account (p. 11–155), with keys, and tabulated statistical data, of 340 species in 115 genera, 38 families. Brief descriptions of species are given with information on habitat and geographic distribution (text maps). The area covered is Canada north of the tree-line, approx. 900,000 sq. mi. of land, of which some 549,000 sq. mi. represents the arctic archipelago. ***Copy seen:*** DLC.

54102. PORTENKO, LEONID ALEKSANDROVICH, 1896– . Studien an einigen seltenen Limicolen aus dem nördlichen und östlichen Sibirien, I. (Journal für Ornithologie, Oct. 1957. Bd. 98, Heft 4, p. 454–66, illus., plate 15–16.) 12 refs. Text in German. ***Title tr.:*** Studies on some rare Limicolae from northern and eastern Siberia.

Contains a detailed study of the spoon-billed sand-piper, *Eurynorhynchus pygmaeus,* which breeds exclusively on the western coast of the Bering Strait (approx. 60° N. 166° to 170°30′ E.). Its geographic distribution, frequency, arrival, pairing, nesting, care and feeding of the young are dealt with; systematic notes are added. ***Copy seen:*** DSI.

54103. PORTENKO, LEONID ALEKSANDROVICH, 1896– . Die zoogeographische Erforschung Nordost-Asiens. (Journal für Ornithologie, 1958. Bd. 99, Heft 2, p. 192–202, table.) Text in German. ***Title tr.:*** The zoogeographic exploration of northeast Asia.

Reviews work of the earlier ornithologists and that of the author during the last 25 years: in the Anadyr' region (town of Markovo) and the Chukotsk Peninsula during the Arctic Institute expedition of 1931–32, also in 1938; and on Vrangel Island in 1938–39 and in 1956. Typical species are listed, and observations on bird succession in the tundra and forest-tundra zones in these regions are tabulated. Breeding times of various species are noted. Comparison is made of the regions investigated in northeast Asia and in Alaska, with comment on the influence of geological changes in the Bering Strait area. The author doubts the existence of a solid Bering bridge and sees the Anadyr' lowland and some parts of northeast Asia and Alaska as islands.

Text in Russian. ***Title tr.:*** Certain characteristics of rock pressure and their application to roof arrangements in placer mines in permafrost.

Reports results of investigations at an unidentified locality in northeast U.S.S.R. on the deformation of roofs in placer mines 8–18 m. deep in permafrost. The vertical displacements of the roof were determined from periodic measurements of the distance between roof and floor, the load on roof supports, and their deformation. Three phases of deformation were observed: at the beginning of operations, little sagging occurred since the deformation of frozen ground was within its elastic limit. In the second phase, the rate of sagging increased as a result of plastic deformations and viscous flow; supports were forced into the roof a distance of 50 mm., whereupon cracks formed in the roof and the supports 20–30 m. from the end of the stope broke. In the third phase the roof began to collapse,

while supports 10–15 m. from the stope end were shattered. The maximum rate of deformation (3–5 mm. per hr.) was observed in the center of the stope.—From SIPRE. ***Copy seen:*** DLC.

Under the impact of cultural and economic development, the non-Russian peoples in Siberia have succeeded in consolidating themselves into socialist nations (the Yakuts, Buryats), socialist peoples (the Chukchis, Koryaks, Khanty and Mansi, Nentsy, etc.), or into small ethnic groups. The small national groups, however, cannot create a culture of their own, and further development requires that these adhere to the culture of the larger peoples and nations. The process of consolidation advances in the form of unification and assimilation of the smaller ethnic groups with the bigger nations. The leading role in this development belongs to the Russian nation. These processes of consolidation should be studied. ***Copy seen:*** DLC.

Discussion of primary and secondary responses to (cold) stress; responses in unexperienced and experienced animals; the role of intermediary metabolism, especially of enzymes and hormones in cold-adaptation. ***Copy seen:*** DLC.

54112. POULSEN, ARTHUR O. The iron ore resources of Norway. (*In:* International Geological Congress. 19th, *Algiers*, 1952. t. 2, p. 389–97, map in atlas vol.) 6 refs.

The Norwegian iron-ore supply is probably over one million tons ore concentrate. In the North are several large, partly explored, deposits, with iron content averaging 28–35% and over. The Sydvaranger deposits, which supply most of the present production are associated with Archean quartz banded rocks. Iron is also found in mica schist-marble rock series in Troms. In addition to these sedimentary deposits, there are several small magmatic deposits in the arctic area. The country has large quantities of low grade, potential iron reserves. The ores are summarized according to location, known and estimated reserves, and other mineral content.
